Features:
- 8 inputs are user selectable from the following.
  - 0-5V, 0-10V, 4-20 mA or 0-20 mA
  - Digital inputs for interface to switches, etc.
  - PWM signal, pulse or 16-bit counter inputs from sensors or diesel engine ECM’s
  - Enable or disable input commands
- 8 voltage reference outputs power external sensors
- 8 analog outputs (0-5V, 0-10V, +/-5V, +/-10V, 0-20 mA, 4-20 mA)
- 12/24VDC input power (nominal)
- 1 CANopen® port, 1 RS-232
- SAE J1939 module (P/N: AX030200) – Refer to datasheet #TDAX030200.
- Rugged IP65 packaging and connectors
- Program the controller for a specific application using its predefined internal functional blocks and any commercially available CANopen® tool.

Description: The controller features 1 CAN port for user-defined communications over the bus. It accepts up to 8 signal inputs which are user selectable as analog (0-5V, 0-10V, 0-20 mA or 4-20 mA), digital, PWM, frequency or counter inputs. Voltage references are provided to power external sensors. The user can alternatively select PWM inputs. Each can be configured to measure the input value, and send the data to a CANopen® network. The I/O module provides 8 analog outputs (0-5V, 0-10V, +/-5V, +/-10V, 0-20 mA, 4-20 mA). Diagnostics messages are provided over the CAN network for the status of inputs or outputs. A RS-232 port is provided for user configuration via PC or for diagnostic purposes. Rugged IP65 rated packaging in addition to a 12 or 24V power supply input section suits power generation and large engine applications. The programmable internal architecture provides users with an ultimate flexibility, allowing them to build their own custom controller with a required functionality from a set of predefined internal functional blocks using any commercially available CANopen® tools.

Applications:
- Power generation, Cogeneration, Stationary power
- Large engines

Ordering Part Numbers:
CANopen® 16 Analog I/O Controller: AX030201
If the standard software or setpoint files are not suitable for your application, contact Axiomatic.

EDS File, UMAX030201: CD-AX030201

Accessories: Mating plug kit AX070200 (8-pin and 40-pin, no key)
Technical Specifications:

### Input Power

<table>
<thead>
<tr>
<th>Power Supply Input - Nominal</th>
<th>12, 24VDC nominal (9...32 VDC power supply range)</th>
<th>Surge protection is provided.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If batteries are used, an alternator or other battery-charging device is necessary to maintain a stable supply voltage. Central suppression of any surge events should be provided at the system level. The installation of the equipment must include overcurrent protection between the power source and the module by means of a series connection of properly rated fuses or circuit breakers. Input power switches must be arranged external to the 16 Analog I/O Module.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Power input wiring should be limited to 10 meters.</td>
<td></td>
</tr>
</tbody>
</table>

### Reverse Polarity Protection

Provided

---

### Input Signals

#### All Inputs

Up to 8 inputs are selectable by the user. All inputs, except for frequency, are sampled every 1ms. The user can select the type of filter that is applied to the measured data, before it is transmitted to the bus. The available filters are:
- Filter Type 0 = No Filter
- Filter Type 1 = Moving Average
- Filter Type 2 = Repeating Average

With the CAN model, AX030201, all input channels are completely independent of each other as well as can simultaneously control an on-board output and send a CAN message to the bus. Refer to the user manual for details.

#### Input Configuration

Up to 8 inputs are available. Refer to Table 1.0. Each input can be configured for any one of the following options.
- Disable input
- 0...5VDC or 0...10VDC
- 4...20mA or 0...20mA
- Digital input
- PWM signal
- Pulse (Hz or RPM)
- 16-bit Counter

#### Threshold Levels

For digital, PWM, pulse or counter inputs the voltage threshold levels are:

- **Input positive threshold (signal goes from low to high):**
  - Min. 2.2V, typical 2.9V, max. 3.6V
- **Input negative threshold (signal goes from high to low):**
  - Min. 1.2V, typical 1.7V, max. 2.3V

#### Analog GND

8 Analog GND connections are provided.

#### Voltage References

8 +5V references (sourcing up to 10 mA) +/- 0.1%
10 mA constant (voltage up to power supply) +/- 0.2%

#### Input Accuracy

<table>
<thead>
<tr>
<th>Voltage Range</th>
<th>Accuracy</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-5V</td>
<td>+/- 0.3%</td>
</tr>
<tr>
<td>0-10V</td>
<td>+/- 0.2%</td>
</tr>
<tr>
<td>0-20mA</td>
<td>+/- 0.35%</td>
</tr>
</tbody>
</table>

PWM, single channel: +/- 0.05% to +/- 1.25% (over the 500 Hz to 10 kHz range)

**Note:** When selecting all input types as “PWM Duty Cycle” the inputs will be accurate at frequencies above 3 kHz.

Frequency/RPM, single channel: +/- 1%

16-bit counter, single channel: +/- 3 mSec (@50 Hz)

#### Input Resolution

<table>
<thead>
<tr>
<th>Voltage Range</th>
<th>Resolution</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-5V</td>
<td>1 mV resolution</td>
</tr>
<tr>
<td>0-10V</td>
<td>1 mV resolution</td>
</tr>
<tr>
<td>0-20mA</td>
<td>1 µA resolution</td>
</tr>
</tbody>
</table>

PWM, single channel: +/- 0.05% to +/- 1.25%, 2 decimal place resolution

**Note:** If the Input Maximum setpoint is set for a low frequency (<=50Hz), the controller will use a different technique to measure the frequency. Instead of measuring the pulses in the Measuring Window (this parameter is ignored) it will measure the time between rising edges of the signal. If more than 10 seconds pass without a transition, the input will be read as zero. The frequency range in this mode is 0.5-50Hz, with up to 2 decimal places of resolution.

Frequency/RPM (single channel)

- 0.5 Hz to 50 Hz: +/- 0.01Hz, 2 decimal place resolution
- 50 Hz to 10kHz: +/- 1Hz, 0 decimal place resolution

16-bit counter, single channel: 1 pulse resolution

#### Input Scan Rate

1 mSec

#### Input Impedance

</tr>
</tbody>
</table>
| Universal Analog Inputs | Up to 8 analog inputs are available. 0…5VDC or 0…10VDC  
The offset is in volts and the resolution setpoint is V/bit, when sending a CAN message. Error detection setpoints are interpreted in volts. 4…20mA or 0…20mA  
The offset is in milliamps and the resolution setpoint is mA/bit, when sending a message. Error detection setpoints are interpreted in milliamps.                                                                                                      |
| Digital Inputs       | Up to 8 digital inputs are available. The input accepted is active high (switch is connected to a +V signal when ON). The controller interprets the offset as a state (OFF=0 or ON=1) and the resolution setpoint as state/bit, when sending the message. Error detection setpoints are not used, since error detection is not possible in this mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PWM Signal Inputs    | Up to 8 PWM inputs are available to interface to a PWM signal from an ECM, PLC, etc. PWM Signal Frequency: 50 – 10,000 Hz  
Amplitude: 5-12V  
PWM Duty Cycle: 0 to 100%  
The offset is interpreted as percent duty cycle (%dc) and the resolution setpoint as %dc/bit, when sending the CAN message. Error detection setpoints will be interpreted in %dc. NOTE: If the Input Maximum setpoint is set for a low frequency (<=50Hz), the controller will use a different technique to measure the frequency. Instead of measuring the pulses in the Measuring Window (this parameter is ignored) it will measure the time between rising edges of the signal. If more than 10 seconds pass without a transition, the input will be read as zero. The frequency range in this mode is 0.5-50Hz, with up to 2 decimal places of resolution. |
| Pulse Inputs         | Up to 8 pulse inputs are available. This input counts the number of pulses over the period of the measuring window setpoint and calculates the frequency of the pulses. Hz = With a pulse per revolution of 0, the controller calculates the offset in Hz and the resolution setpoint as Hz/bit, when sending the CAN message. Error detection setpoints are in Hertz. RPM = With a non-zero pulse per revolution, the frequency is interpreted as a RPM input. The offset is in revolutions per minute (RPM) and the resolution setpoint is RPM/bit. Error detection setpoints are interpreted in RPM.  
NOTE: The difference between Frequency and Counter mode is that the Frequency mode measures the number of pulses that occur in the Measuring Window period and calculates frequency, while the counter gives the period of time (in milliseconds) it takes for the number of pulses in the Measuring Window to be read at the input. |
| 16-bit Counter Inputs | Up to eight 16-bit counter inputs are available. A counter input cannot be used to control an output. The input is configured to count pulses on the input until the value in the measuring window setpoint is reached. While the counter is active, a timer with a 1ms resolution is running in the background. When the count has been reached, the value in the 1ms timer is captured and updated to the input feedback variable. The timer is reset until the count value once again reaches the measuring window. Input and error detection setpoints are not used, since error detection is not possible in this mode.  
NOTE: If set to be a 16-bit counter, the input can no longer be used as either a control signal or an enable input to any of the outputs on the ECU. |
## Outputs

### Analog Outputs

User selectable (0-5V, 0-10V, +/-5V, +/-10V, 0-20 mA, 4-20 mA)

Each analog output can be configured for one of the following options, and the properties and behavior of the output in each mode is described below in Table 2.0.

<table>
<thead>
<tr>
<th>Table 2.0 Analog Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0 to 5 Volts</strong></td>
</tr>
<tr>
<td>The output is configured to drive a voltage output in the range of 0V to 5V. If feedback messages are used to send the output value to the bus, then the message will be sent with a resolution of 1mV/bit, and a 0mV offset.</td>
</tr>
<tr>
<td><strong>-5 to 5 Volts</strong></td>
</tr>
<tr>
<td>The output is configured to drive a voltage output in the range of -5V to 5V. If feedback messages are used to send the output value to the bus, then the message will be sent with a resolution of 1mV/bit, and a -5000mV offset.</td>
</tr>
<tr>
<td><strong>0 to 10 Volts</strong></td>
</tr>
<tr>
<td>The output is configured to drive a voltage output in the range of 0V to 10V. If feedback messages are used to send the output value to the bus, then the message will be sent with a resolution of 1mV/bit, and a 0mV offset.</td>
</tr>
<tr>
<td><strong>-10 to 10 Volts</strong></td>
</tr>
<tr>
<td>The output is configured to drive a voltage output in the range of -10V to 10V. If feedback messages are used to send the output value to the bus, then the message will be sent with a resolution of 1mV/bit, and a -10000mV offset.</td>
</tr>
<tr>
<td><strong>0(4) to 20 Milliamps</strong></td>
</tr>
<tr>
<td>The output is configured to source a current in the range of 0mA to 20mA. If feedback messages are used to send the output value to the bus, then the message will be sent with a resolution of 1uA/bit, and a 0uA offset. Compliance voltage is 10Vdc.</td>
</tr>
</tbody>
</table>

### Output Accuracy

<table>
<thead>
<tr>
<th>Voltage Output: +/- 0.4%</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Output: +/- 0.4%</td>
</tr>
</tbody>
</table>

### Output Resolution

15-bit PWM

### Output Adjust Rate

1 mSec.

### Output Response

For each output type, if the control signal is one of the inputs on the board, then there are up to six output profiles that can be selected to determine how the output will react to a change at the input. Refer to Figures 1, 2 and 3 below.

**Note 1:** If the control input is set to a digital type, the output will jump to the maximum setpoint when the input is ON and jump to the minimum setpoint when the input is OFF.

**Note 2:** For outputs that are controlled using CAN, only the “Single Profile” responses will be used (single or dual slope).

### Output Setpoints

There are six setpoints that will determine how an input controls the output’s behavior. There are four setpoints that define an output type and response. There are five setpoints that define an output’s behavior depending on the profile used.

### Short Circuit Protection

Individual short circuit protection is provided.

### Other Protection

Each output is protected against miswiring.

### Accuracy

0.5%

### Response Time

1 mSec.

### Output Short Circuit Protection

Fully protected (all physical pins, all inputs, outputs and power)

Communications

1 CAN port (CANopen®)
- N.B. Default baud rate is 125kBit/s (user configurable).
1 RS-232

The controller’s object dictionary is compatible with the CiA DS-404 device profile (Device profile for measurement devices and closed-loop controllers). In addition to the standard objects for this device profile, the controller also includes a number of manufacturer specific objects to extend the functionality beyond that of the basic profile.

The Axiomatic AX030201 is compliant with the following CAN in Automation (CiA) standards.

- [DS-301] CiA DS-301 V4.02 – CANopen® Application Layer and Communication Profile. CAN in Automation 2002
- [DS-305] CiA DS-305 V2.0 – Layer Setting Service (LSS) and Protocols. CAN in Automation 2006

User Interface

EDS File is provided.

The controller architecture consists of a set of internal functional blocks, which can be individually programmed and arbitrarily connected together to achieve the required system functionality for a specific application. All objects are user configurable using standard commercially available tools that can interact with a CANopen® Object Dictionary via an .EDS file.

Diagnostics

Diagnostics messages are provided over the CAN network for the status of inputs or outputs. Refer to the user manual.

Operating Conditions

-40 to 85°C (-40 to 185°F)

Protection

IP65, Unit is conformal coated in the housing.

Weight

2.30 lbs. (1.04 kg)

Electrical Connections

8-pin Deutsch IPD P/N: DT13-08PA
Mating plug p/n: DT06-08SA with wedge W8S and sockets 0462-201-16141
40-pin Deutsch IPD P/N: DRC13-40PA
Mating plug p/n: DRC16-40SA or DRC18-40SA with sockets 0462-201-16141
Packaging and Dimensions

Aluminum extrusion with stainless steel end plates.
For dimensions, see below.

Grounding

Protective Earth (PE) must be connected to the grounding stud to reduce the risk of electric shock. The conductor providing the connection should have a ring lug and wire larger than or equal to 4 mm² (12 AWG). The ring lug should be placed between the nut and a star washer. (To secure the ground strap, use an 8-32 "K-LOK” locknut, stainless steel, 3/8” O.D.)

All chassis grounding should go to a single ground point designated for the machine and all related equipment.

The ground strap that provides a low impedance path for EMI should be a ½ inch wide, flat, hollow braid, no more than 12 inches long with a suitable sized ring lug for the module’s grounding lug. It may be used in place of the PE grounding conductor and would then perform both PE and EMI grounding functions.
| **Shielding** | The CAN wiring should be shielded using a twisted conductor pair. All wire shields should be terminated externally to the grounding lug on the mounting foot. The input wires should not be exposed for more than 2 inches (50 mm) without shielding. Shields can be ac grounded at one end and hard grounded at the opposite end to improve shielding. If the module is installed in a cabinet, shielded wiring can be terminated at the cabinet (earth ground), at the entry to the cabinet or at the module. |
| **CAN Wiring** | The CAN port is electrically isolated from all other circuits. The isolation is SELV rated with respect to product safety requirements. Refer to the CAN specification for more information. Use CAN compatible cabling. Shielded CAN cable is required. The module provides the CAN port shield connection ac coupled to chassis ground. The chassis ground stud located on the mounting foot must be tied directly to Earth Ground. |
| **Network Construction** | Axiomatic recommends that multi-drop networks be constructed using a “daisy chain” or “backbone” configuration with short drop lines. |
| **Termination** | It is necessary to terminate the network with external termination resistors. The resistors are 120 Ohm, 0.25W minimum, metal film or similar type. They should be placed between CAN_H and CAN_L terminals at both ends of the network. |
| **Mounting** | Mounting ledges include holes sized for ¼ inch or M6 bolts. The bolt length will be determined by the end-user’s mounting plate thickness. Typically ¾ inch (20 mm) is adequate. If the module is mounted without an enclosure, it should be mounted vertically with connectors facing left and right to reduce likelihood of moisture entry. The CAN wiring is considered intrinsically safe. The power wires are not considered intrinsically safe and so in hazardous locations, they need to be located in conduit or conduit trays at all times. The module must be mounted in an enclosure in hazardous locations for this purpose. No wire or cable harness should exceed 30 meters in length. The power input wiring should be limited to 10 meters. All field wiring should be suitable for the operating temperature range of the module. |
| **Note:** | CANopen® is a registered community trade mark of CAN in Automation e.V. Specifications are indicative and subject to change. Actual performance will vary depending on the application and operating conditions. Users should satisfy themselves that the product is suitable for use in the intended application. All our products carry a limited warranty against defects in material and workmanship. Please refer to our Warranty, Application Approvals/Limitations and Return Materials Process as described on www.axiomatic.com/service.html. |

Form: TDAX030201-07/26/17
