VERSION HISTORY

Version	Date	Author	Modification
1.00.	Sep 2, 2021	Ilona Korpelainen	Initial Draft
1.00A	Sep 15, 2021	Ilona Korpelainen	Updated to match firmware
-	Dec. 20, 2021	Amanda Wilkins	Updated dimensional drawing
1.01	July 13, 2023	M Ejaz	Fixed legacy issues Updated dimensional drawing
1.02	July 27, 2023	Kiril Mojsov	Fixed legacy issues

ACRONYMS

BATT +/-	Battery positive (a.k.a. Vps) or Battery Negative (a.k.a. GND)
CAN	Control Area Network
CANopen®	CANopen® is a registered community trademark of CAN in Automation e.V.
CAN-ID	CAN 11-bit Identifier
COB	Communication Object
CTRL	Control
EDS	Electronic Data Sheet
EMCY	Emergency
GND	Ground reference (a.k.a. BATT-)
LSB	Least Significant Byte (or Bit)
LSS	Layer Settling Service
LUT	Lookup Table
MI	Magnetic Input
MSB	Most Significant Byte (or Bit)
NMT	Network Management
RO	Read Only Object
RPDO	Received Data Object
RPM	Rotations per Minute
RW	Read/Write Object
SDO	Service Data Object
TPDO	Transmitted Process Data Object
Vps	Voltage Power Supply (a.k.a. BATT+)
WO	Write Only Object

TABLE OF CONTENTS

1. OVERVIEW OF CONTROLLER	12
1.1. Digital Function Block	15
1.2. Input Function Block	16
1.3. Digital Output Function Block	22
1.4. Analog Output Function Block	24
1.5. Internal Function Block Control Source	30
1.6. PID Function Block	32
1.7. Lookup Table Function Block	34
1.7.1. X-Axis, Input Data Response	35
1.7.2. Y-Axis, Lookup Table Output.....	35
1.7.3. Point to Point Response	35
1.8. Programmable Logic Function Block.....	38
1.8.1. Conditions Evaluation	40
1.8.2. Table Selection	42
1.8.3. Logic Block Output.....	43
1.9. Math Function Block	43
1.10. Miscellaneous Function Block	45
1.11. Inching Control Block.....	47
2. CANOPEN® OBJECT DICTIONARY	50
2.1. Node ID and Baudrate	50
2.1.1. LSS Protocol to Update	50
2.2. Communication Objects (DS-301 and DS-404)	53
2.2.1. Object 1000h: Device Type	54
2.2.2. Object 1001h: Error Register	55
2.2.3. Object 1002h: Manufacturer Status Object	55
2.2.4. Object 1003h: Pre-Defined Error Field	55
2.2.5. Object 100Ch: Guard Time.....	57
2.2.6. Object 100Dh: Lifetime Factor	57
2.2.7. Object 1010h: Store Parameters	58
2.2.8. Object 1011h: Restore Parameters	59
2.2.9. Object 1016h: Consumer Heartbeat Time..	60
2.2.10. Object 1017h: Producer Heartbeat Time.....	61
2.2.11. Object 1018h: Identity Object	61
2.2.12. Object 1020h: Verify Configuration.....	62
2.2.13. Object 1029h: Error Behavior	63
2.2.14. RPDO Behavior	64
2.2.15. TPDO Behavior.....	67
2.3. Application Objects (DS-404)	69
2.3.1. Object 6000: DI Read State 8 Input Lines	70

2.3.2.	Object 6002: DI Polarity 8 input Lines	70
2.3.3.	Object 7100h: AI Input Field Value	71
2.3.4.	Object 6110h: AI Sensor Type	71
2.3.5.	Object 6112h: AI Operating Mode	72
2.3.6.	Object 7120h: AI Input Scaling 1 FV	72
2.3.7.	Object 7121h: AI Input Scaling 1 PV	73
2.3.8.	Object 7122h: AI Input Scaling 2 FV	73
2.3.9.	Object 7123h: AI Input Scaling 2 PV	74
2.3.10.	Object 7130h: AI Input Process Value.....	74
2.3.11.	Object 6132h: AI Decimal Digits PV	75
2.3.12.	Object 7148h: AI Span Start.....	76
2.3.13.	Object 7149h: AI Span End	76
2.3.14.	Object 61A0h: AI Filter Type.....	77
2.3.15.	Object 61A1h: AI Filter Constant	77
2.3.16.	Object 6200h: DO Write state 8 Output lines	78
2.3.17.	Object 6202h: DO Polarity 8 Input Lines	78
2.3.18.	Object 6250h: DO Fault Mode 1 Output Line	79
2.3.19.	Object 6260h: DO Fault State 1 Output Line.....	79
2.3.20.	Object 7300h: AO Output Process Value	80
2.3.21.	Object 6302h: AO Decimal Digits PV	80
2.3.22.	Object 6310h: AO Output Type	81
2.3.23.	Object 7320h: AO Output Scaling 1 PV.....	81
2.3.24.	Object 7321h: AO Output Scaling 1 FV.....	82
2.3.25.	Object 7322h: AO Output Scaling 2 PV.....	82
2.3.26.	Object 7323h: AO Output Scaling 2 FV.....	83
2.3.27.	Object 7330h: AO Output Field Value	84
2.3.28.	Object 6332h: AO Decimal Digits FV	84
2.3.29.	Object 6340h: AO Fault Mode	85
2.3.30.	Object 7341h: AO Fault Field Value	85
2.3.31.	Object 7450h: PID Proportional Band	86
2.3.32.	Object 7452h: PID Integral Action Time	86

1. OVERVIEW OF CONTROLLER

The Dual Channel Universal Signal Controller with CANopen® (2IN-2OUT-SIG-CO) is designed for extremely versatile control of up to two signal level outputs. The controller is widely configurable through CANopen® Objects. Its flexible circuit design gives the user a large range of configurable input and output types. The sophisticated control algorithms allow the user to program the controller for an extensive range of applications without the need for customer software.

Figure 1 – Hardware Functional Block Diagram

The controller has two fully programmable universal inputs that can be setup to read: voltage, current, resistive, frequency or digital input signals. There are also two universal outputs that can be setup to output: voltage (0-5V, 0-10V, +/-5V or +/-10V), current (0-20mA, 4-20mA), PWM (fixed frequency), Frequency (fixed duty cycle), variable PWM and Freq, and Digital On/Off. All I/O ports on the unit are fully independent from another.

The controller is four way isolated. Power supply input is galvanic-isolated from bias power supplies. Universal inputs are digitally isolated from universal outputs and CAN Bus. Each isolation section is provided with individual ground. 5V Reference is provided from input section.

Logical (software) function blocks are depicted in Figure 2. To produce desired control 2 PID Control Blocks, 8 Lookup Tables, 4 Programmable Control Logics, 4 Mathematical Function Blocks and an Inching Block are provided. All functional blocks are independent from one another but can be programmed to interact in numerous ways. The function blocks are outlined in following sections. All objects are user-configurable using standard commercially available tools that can interact with a CANopen® Object Dictionary via an .EDS file.

Figure 2 – Logic Functional Block Diagram

1.1. Digital Function Block

The digital input (DI) function block only becomes applicable on the input when object 6112h, **AI Operation**, is set to a digital input response.

Figure 3 – Digital Input Objects

When object 6112h is set to 10 = *Digital Input*, object 2020h **DI Pull-up/Pull-down Mode** will determine the configuration of the internal Pull-up/Pull-down resistors. The options for object 2020h are shown in Table 1, with the default bolded.

Value	Meaning
0	Pullup/Down Disabled (high impedance input)
1	10kΩ Pullup Resistor Enabled
2	10kΩ Pulldown Resistor Enabled

Table 1 – DI Pullup/Down Options

Figure 4 shows the hysteresis on the input when switching a discrete signal. A digital input can be switched up to +Vcc (42Vmax.)

Figure 4 – Discrete Input Hysteresis

Once the raw state has been evaluated, the logical state of the input is determined by object 6002h **DI_Polarity_8_Input_Lines**. The options for object 6002h are shown in Table 2. The state of the DI will be written to read-only object 6000h **DI_Read_state_8_Input_Lines**. By default, normal on/off logic is used.

Value	Meaning
-------	---------

0	Normal On/Off
1	Inverse On/Off

Table 2 – Object 6002h DI Polarity 8 Input Lines Options

The format to write to object 6002h is as follows:

Sub-index 1 will determine the following inputs polarities

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
-	-	-	-	-	-	UI2	UI1

The rest of the bits in sub-index 1 will be ignored.

As per the format of object 6002h, the bits in object 6000h **DI_Read_state_8_Input_Lines** will be written to represent the same inputs' states.

There is another type of ‘digital’ input that can be selected when 6112h is set to 20 = Analog On/Off. However, in this case, the input is still configured as an analog input, and therefore the objects from the Analog Input (AI) block are applied instead of those discussed above. The object 6000h is written as per the logic shown in Figure 5. In this case, the MIN parameter is set by object 7120h **AI Scaling 1 FV**, and the MAX is set by 7122h **AI Scaling 2 FV**. For all other operating modes, object 6000h will always be zero.

Figure 5 – Analog Input Reads as Digital

1.2. Input Function Block

Figure 6 – Analog Input Objects

Object 6112h, **AI Operating Mode** determines whether the AI or DI block is associated with an input. The options for object 6112h are shown in Table 3. No values other than what are shown here will be accepted.

Value	Meaning
0	Channel Off
1	Normal Operation (analog)
10	Digital Input (on/off)
20	Analog and On/Off

Table 3 – Object 6112h - AI Operating Mode Options

The most important object associate with the AI function block is object 6110h **AI Sensor Type**. By changing this value, and associated with it object 2100h **AI Input Range**, other objects will be automatically updated by the controller. The options for object 6110h are shown in Table 4, and no values other than what are shown here will be accepted. The inputs are setup to measure voltage by default.

Value	Meaning
40	Voltage Input
50	Current Input
60	Frequency Input (or RPM)
100	Resistive
10000	PWM Input

Table 4 – Object 6110h - AI Sensor Type Options

The allowable ranges will depend on the input sensor type selected. Table 5 shows the relationship between the sensor type, and the associated range options. The default value for each range is bolded, and object 2100h **AI Range** will automatically be updated with this value when 6110h is

changed. The grayed cells mean that the associate value is not allowed for the range object when that sensor type has been selected.

Value	Voltage	Current	Frequency	Resistive	PWM
0	0 to 5V	0 to 20mA	0.5Hz to 50Hz	20 Ω to 250 kΩ	Low Freq (<1kHz)
1	0 to 10V	4 to 20mA	10Hz to 1kHz		High Freq (>100Hz)
2	-5 to 5V	0 to 200mA	100Hz to 10kHz		
3	-10 to 10V				

Table 5 – AI Input Range Options Depending on Sensor Type

Objects 2020h **DI Pull-up/Pull-down Mode**, 2030h **DI Debounce Filter** and 2101h **AI Number of Pulses per Revolution** are used with frequency and PWM sensor types.

Object 2020h **DI Pull-up/Pull-down Mode** will determine the configuration of the internal Pull-up/Pull-down resistors. The options for object 2020h are shown in Table 1, with the default bolded.

Object 2030h **DI Debounce Filter** is used to select input capture filter applied to the input before the state is read by the processor. The options for object 2030h are shown in Table 6, with the default bolded.

Value	Meaning
0	Filter Disabled
1	Filter 111ns
2	Filter 1.78 us
3	Filter 14.22 us

Table 6 – DI Debounce Filter Options

Figure 7 – Digital Input Debouncing

Frequency measurement can be changed to RPM, by setting object 2101h **AI Number of Pulses per Revolution** to a non-zero value.

All inputs can be further filtered once the raw data has been measured. Object 61A0h **AI Filter Type** determines what kind of filter is used per Table 7. By default, additional software filtering is disabled.

Value	Meaning
0	No Filter
1	Moving Average
2	Repeating Average

Table 7 – Object 61A0h - AI Filter Type Options

Object 61A1h **AI Filter Constant** is used with all three types of filters as per the formulas below:

Calculation with no filter:

Value = Input

The data is simply a ‘snapshot’ of the latest value measured by the ADC or timer.

Equation 1 - Moving Average Transfer Function:

$$\text{Value}_N = \text{Value}_{N-1} + \frac{(\text{Input} - \text{Value}_{N-1})}{\text{Filter Constant}}$$

This filter is called every 1ms. The value Filter Constant stored in object 61A1h is 10 by default.

Equation 2 - Repeating Average Transfer Function:

$$\text{Value} = \frac{\sum_0^N \text{Input}_N}{N}$$

At every reading of the input value, it is added to the sum. At every Nth read, the sum is divided by N, and the result is the new input value. The value and counter will be set to zero for the next read. The value of N is stored in object 61A1h and is 1 by default. This filter is called every 10ms.

The value from the filter is shifted according to read-only object 2102h **AI Decimal Digits FV** and then written to read-only object 7100h **AI Input Field Value**.

The value of 2102h will depend on the **AI Sensor Type** and **Pulses per Revolution** selected and will be automatically updated per Table 9 when either 6110h or 2101h are changed. All other objects associated with the input field value also apply this object. These objects are 7120h **AI Scaling 1 FV**, 7122h **AI Scaling 2 FV**, 7148h **AI Span Start**, 7149h **AI Span End**, and 2111h **AI Error Clear Hysteresis**. These objects are also automatically updated when the Type or Pulses per Rev are changed.

Sensor Type	Decimal Digits
Voltage: All Ranges	3 [mV]
Current: 0-20mA and 4-20mA	3 [uA]
Current: 0-200mA	2 [10 uA]
Frequency: 0.5Hz to 50Hz	2 [0.01 Hz]
Frequency: 10Hz to 1kHz	1 [0.1 Hz]
Frequency: 100Hz to 10kHz	0 [Hz]
Frequency: RPM Mode	1 [0.1 RPM]
Resistive	0 [0.01 kΩ]
PWM: All Ranges	1 [0.1 %]
Digital Input	0 [On/Off]

Table 8 – Object 2102h AI Decimal Digits FV Depending on Sensor Type

It is the **AI Input FV** which is used by the application for error detection, and as a control signal for other logic blocks (i.e. output control.) Object 7100h is mappable to a TPDO and is mapped to TPDO1 by default.

Read-only object 7130h **AI Input Process Value** is also mappable. However, the default values for objects 7121h **AI Scaling 1 PV** and 7123h **AI Scaling 2 PV** are set to equal 7120h and 7122h respectively, while object 6132h **AI Decimal Digits PV** is automatically initialize to equal 2102h. This means that the default relationship between the FV and PV is one-to-one, so object 7130h is not mapped to a TPDO by default.

Should a different linear relationship between what is measured versus what is sent to the CANopen® bus be desired, objects 6132h, 7121h and 7123h can be changed. The linear relationship profile is shown in Figure 7 below. Should a non-linear response be desired, the lookup table function block can be used instead, as described in Section 1.6.

Figure 8 – Analog Input Linear Scaling FV to PV

As stated earlier, the FV scaling objects are automatically updated with the Sensor Type or Range changes. This is because objects 7120h and 7122h are not only used in a linear conversion from FV to PV as described above, but also as the minimum and maximum limits when the input is used to control another logic block. Therefore, the values in these objects are important, even when the AI Input PV object is not being used.

The AI Span Start and AI Span End objects are used for fault detection, so they too are automatically updated for sensible values as the Type/Range changes. The Error Clear Hysteresis object is also updated, as it too is measured in the same unit as the AI Input FV object.

Table 9 lists the default values that are loaded into objects 7120h, 7122h, 7148h, 7149h, and 2111h for each Sensor Type and Pulses per Rev combination. Recall that these objects all have the decimal digits applied to them as outlined in Table 10.

Sensor Type/ Input Range	7148h AI Span Start (i.e. Error Min)	7120h AI Scaling 1 FV (i.e. Input Min)	7122h AI Scaling 2 FV (i.e. Input Max)	7149h AI Span End (i.e. Error Max)	2111h Error Clear Hysteresis
Voltage: 0 to 5V	200 [mV]	500 [mV]	4500 [mV]	4800 [mV]	100 [mV]
Voltage: 0 to 10V	200 [mV]	500 [mV]	9500 [mV]	9800 [mV]	200 [mV]
Voltage: -5V to 5V	-4800 [mV]	-4500 [mV]	4500 [mV]	4800 [mV]	200 [mV]

Voltage: -10V to 10V	-9800 [mV]	-9500 [mV]	9500 [mV]	9800 [mV]	400 [mV]
Current: 0 to 20mA	0 [uA]	1000 [uA]	20000 [uA]	20000 [uA]	250 [uA]
Current: 4 to 20mA	1000 [uA]	4000 [uA]	20000 [uA]	21000 [uA]	250 [uA]
Current: 0 to 200mA	0 [mA]	1 [mA]	200 [mA]	210 [mA]	2.5 [mA]
Freq: 0.5Hz to 50Hz	100 [0.01Hz]	500 [0.01Hz]	5000 [0.01Hz]	5500 [0.01Hz]	20 [0.01Hz]
Freq: 10Hz to 1kHz	50 [0.1Hz]	100 [0.1Hz]	10000 [0.1Hz]	11000 [0.1Hz]	50 [0.1Hz]
Freq: 100Hz to 10kHz	50 [Hz]	100 [Hz]	10000 [Hz]	10500 [Hz]	10 [Hz]
Freq: RPM Mode	500 [0.1RPM]	1000 [0.1RPM]	30000 [0.1RPM]	33000 [0.1RPM]	100 [0.1RPM]
Resistive	2[0.01kΩ]	3[0.01kΩ]	20000 [0.01kΩ]	25000 [0.01kΩ]	1[0.01kΩ]
PWM: 0 to 100%	10 [0.1%]	50 [0.1%]	950 [0.1%]	990 [0.1%]	10 [0.1%]
Digital Input	OFF	OFF	ON	ON	0

Table 9 – AI Object Defaults Based on Sensor Type and Input Range

It might not be desired in a particular application for the automatic updating of objects when a key object is changed, i.e. AI Sensor Type. In this case, object 5550h **Enable Automatic Updates** can be set to FALSE (true by default) in which case changing an object will have no impact on any other objects. In this mode, the user must manually change all the objects for sensible values or the controller will not work as expected.

When changing these objects, Table 10 outlines the range constraints places on each based on the Sensor Type and Input Range combination selected. In all cases, the MAX value is the upper end of the range (i.e. 50000Hz or) Object 7122h cannot be set higher than MAX, whereas 7149h can be set up to 110% of MAX. Object 2111h on the other hand can only be set up to maximum value of 10% of MAX. Table 10 uses the base unit of the input, but recall the limits will also have object 2102h apply to them as per Table 8.

Sensor Type/ Pulses per Rev	7148h	7120h	7122h	7149h	2111h
Voltage: 0 to 5V and 0 to 10V Current: 0 to 20mA and 4 to 20mA RPM: 0 to 6000RPM PWM: 0 to 100%	0 to 7120h	7148h to 7122h			
Current: 4 to 20mA	0 to 7120h	7148h to 7122h If(7148h<4mA) 4mA to 7122h			
Freq: 0.5Hz to 50Hz	0.1Hz to 7120h	7148h to 7122h If(7148h<0.5Hz) 0.5Hz to 7122h			
Freq: 10Hz to 1kHz	5Hz to 7120h	7148h to 7122h If(7148h<10Hz) 10Hz to 7122h			
Freq: 100Hz to 10kHz	50Hz to 7120h	7148h to 7122h If(7148h<100Hz) 100Hz to 7122h			
Voltage: 0 to 5V and 0 to 10V Current: 0 to 20mA and 4 to 20mA RPM: 0 to 6000RPM PWM: 0 to 100%	0 to 7120h	7148h to 7122h	7120h to 7149h If(7149h>MAX) 7120h to MAX	7122h to 110% of MAX	10% of MAX

Table 10 – AI Object Ranges Based on Sensor Type and Input Range

The last objects associated with the analog input block left to discuss are those associated with fault detection. Should the calculated input (after measuring and filtering) fall outside of the

allowable range, as defined by the AI Span Start and AI Span End objects, an error flag will be set in the application if and only if object 2110h **AI Error Detect Enabled** is set to TRUE (1).

When (7100h AI Input FV < 7148h AI Span Start), an “Out of Range Low” flag is set. If the flag stays active for the 2112h **AI Error Reaction Delay** time, an Input Overload Emergency (EMCY) message will be added to object 1003h **Pre-Defined Error Field**. Similarly, when (7100h AI Input FV > 7149h AI Span End), an “Out of Range High” flag is set and will create an EMCY message should it stay active throughout the delay period. In either case, the application will react to the EMCY message as defined by object 1029h **Error Behavior** at the sub-index corresponding to an Input Fault. Refer to section 2.2.4 and 2.2.13 for more information about objects 1003h and 1029h.

Once the fault has been detected, the associate flag will be cleared only once the input comes back into range. Object 2111h **AI Error Clear Hysteresis** is used here so that the error flag will not be set/cleared continuously while the AI Input FV hovers around the AI Span Start/End value.

To clear an “Out of Range Low” flag, AI Input FV >= (AI Span Start + AI Error Clear Hysteresis)

To clear an “Out of Range High” flag, AI Input FV <= (AI Span End - AI Error Clear Hysteresis)

Both flags cannot be active at once. Setting either one of these flags automatically clears the other.

1.3. Digital Output Function Block

The digital output (DO) function block only becomes applicable on the output when object 6310h, **AO Output Type**, is set to a digital output type (Output type = 1000 or 1020).

Figure 9 – Digital Output Objects

Several of the objects shown in the above diagram are in fact associated with the Analog Output function block, and are explained in detail in Section 1.4. Therefore, this section will only elaborate on the objects unique to the DO function block.

An output can be controlled either by an on-board control signal (such the result from a lookup table or a math function) or a CANopen® object that has been mapped to an RPDO. In the case of an output configured for a digital response, when a CANopen® Message has been selected as the 2340h **AO Control Input Source** (see Table 22), then data from the appropriate bit within the sub-index from write-mappable object 6200h **DO_Write_state_8_output_lines** will be used as the control signal. The format of object 6200h will be as follows:

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
-	-	-	-	-	-	DO2	DO1

The Enable and Override Inputs and Responses in the digital mode are the same as for an Analog Output, and are evaluated in the same order. Therefore, what is described in Section 1.4 for these also applied for the DO function block for the outputs.

As with the AO function, the DO1 and DO2 will respond to the Control Input if and only if the following conditions have been met:

- a) No fault is detected for any of the control signals
- b) The override command is either ignored or false (Override Input)
- c) The output has not been disabled by a secondary signal (Enable Input)

The resulting **DO_Write_state_8_output_lines** will depend on the object 6202h **DO_Polarity_8_output_lines**, as per Table 11. By default, normal on/off output logic is used.

Value	Meaning	DO Logic State	DO Drive State
0	Normal On/Off	OFF	OFF
		ON	ON
1	Inverse On/Off	OFF	ON
		ON	OFF

Table 11 – Object 6202h DO Polarity Options

Objects 2224h **Digital Out Delay** and 2225h **Delay Polarity** are used set a state change delay to the digital output. **Delay Polarity** value determines which state change edge the delay will affect and **Digital Out Delay** value determines length of the delay in milliseconds. By default, **Digital Out Delay** is set to 0ms (no delay) and **Delay Polarity** is set to rising edge – in which case the output will react as soon as it is commanded.

0	Rising Edge
1	Falling Edge

Table 12 – Object 2225h DO Delay Polarity Options

As mentioned in the Controller Overview, any digital output can be setup to react to a fault detected on any of the **inputs** to the function block (control, enable or override.) Should any one of these inputs be showing an error condition, object 6250h **DO Fault Mode** determines how the

output will respond, per Table 13. By default, the output will revert to the state defined in object 6260h **DO Fault State**.

Value	Meaning
0	Maintain Last State
1	Apply Pre-Defined State

Table 13 – Object 6250h DO Fault Mode Options

1.4. Analog Output Function Block

Figure 10 – Analog Output Objects

Together Objects 6310h **AO Output Type** and 2302h **AO Output Range** define how the output drive circuitry will be configured. Options for object 6310h **AO Output Type** are shown in Table 1. This table also shows the output unit and range for each type. By default, analog outputs are configured as voltage outputs.

Value	Meaning
0	Output Disabled
10	Output Voltage

20	Output Current
30	Output Frequency
40	Output PWM
1000	Output Digital On/Off
1001	Output Mixed PWM and Freq

Table 14 – Object 6310h AO Output Type Options

The allowable ranges will depend on the output type selected. Table 5 shows the relationship between the output type, and the associated range options. The default value for each range is bolded, and object 2302h **AO Output Range** will automatically be updated with this value when 6310h is changed. The grayed cells mean that the associate value is not allowed for the range object when that output type has been selected.

Value	Voltage	Current	Frequency	PWM	Digital	Mixed
0	0 to 5V	0 to 20mA	0Hz to 50kHz	0 to 100	On/Off	0 to 100
1	0 to 10V	4 to 20mA				
2	-5 to 5V					
3	-10 to 10V					

Table 15 – AO Output Range Options Depending on Output Type

When the output type is changed, all objects related to the output (scaling PV, Decimal Digits PV, etc.) are automatically updated by default. Object 5550h enables/disables automatic updates. When disabled (set to False), the objects are to be manually configured.

Sensor Type/ Input Range	7321h AO Scaling 1 FV (i.e. Input Min)	7323h AO Scaling 2 FV (i.e. Input Max)	2300h AO Override Field Value	7341h AO Fault Field Value	2311h Error Clear Hysteresis	6332h AO Decimal Digits FV
Voltage: 0 to 5V	0 [mV]	5000 [mV]	5000 [mV]	0 [mV]	100 [mV]	3 [mV]
Voltage: 0 to 10V	0 [mV]	10000 [mV]	10000 [mV]	0 [mV]	100 [mV]	3 [mV]
Voltage: -5 to 5V	-5000 [mV]	5000 [mV]	5000 [mV]	0 [mV]	100 [mV]	3 [mV]
Voltage: -10 to 10V	-10000 [mV]	10000 [mV]	10000 [mV]	0 [mV]	100 [mV]	3 [mV]
Current: 0 to 20mA	0 [uA]	20000 [uA]	20000 [uA]	0 [uA]	1000 [uA]	3 [uA]
Current: 4 to 20mA	4000 [uA]	20000 [uA]	20000 [uA]	4000 [uA]	1000 [uA]	3[uA]
Freq: 0Hz to 50kHz	50 [Hz]	25000[Hz]	100[Hz]	50 [Hz]	50 [Hz]	0 [Hz]
PWM: 0 to 100%	10 [1%]	90 [1%]	50[1%]	10 [1%]	5 [1%]	0[1%]
Digital	OFF	ON	ON	OFF	0	0
Mixed PWM and Freq	10 [1%] 50 [Hz]	90 [1%] 25000[Hz]	50[1%] NA	10 [1%] NA	5 [1%] NA	0[1%] 0 [Hz]

Table 16 – AO Object Defaults Based on Output Type and Input Range

The relationship between the Process Value (input) and the Field Value (output) is a linear one, as shown in Figure 10. However, the output will use the AO Scaling FV objects as limits to the drive, such that the output will hold at the minimum and maximum FV points, as shown in the figure.

Figure 11 – Analog Output Linear Scaling PV to FV

The 2IN-2OUT-SIG-CO controller allows for the PV input to be selected from the list of the logical function blocks supported by the controller as shown in Figure 2. As a result, any output from one function block can be selected as the control source for another. Keep in mind that not all options make sense in all cases, but the complete list of control sources is shown in Table 22. By default, analog outputs are setup to respond to the corresponding CANopen® RPDO message.

There are three inputs to the output function block, each one with a unique source and number object. For the control function (PV axis in Figure 11) objects 2340h **AO Control Input Source** and 2341h **AO Control Input Number** are used. For the enable function, objects 2350h **AO Enable Input Source** and 2351h **AO Enable Input Number** are used. Lastly, for the override function, objects 2360h **AO Override Input Source** and 2361h **AO Override Input Number** are used.

In addition, with Mixed PWM and Frequency Output type, fourth input is utilized to control frequency of the output signal. While **AO Control Input Source** and **AO Control Input number** select signal to control PWM of the Mixed type output, objects 2390h **AO Frequency Input Source** and 2391h **AO Frequency Input Number** select signal to control frequency of the mixed type output. Objects 2392h **AO Frequency Scaling 1 FV** and 2394h **AO Frequency Scaling 2 FV** are used to limit and scale the signal.

When using any control source as the X-Axis input to a function block, the corresponding scaling limits are defined as per Table 17. It is the responsibility of the user to make sure that the scaling objects for any function block are setup appropriately depending on the source selected for the X-Axis input.

Note that for the Outputs, the actual objects for the scaling (6302h, 7320h, 7322h) should be edited to match the objects defined in this table when the control source is changed.

Control Source	Scaling 1	Scaling 2	Dec Digits
CANopen® Message – Num 1 to 10	7230h	7322h	6302h
CANopen® Message – Num 11 to 25	2520h	2522h	2502h
Constant Function Block	N/A	N/A	N/A (float)
PID Control Function Block	0%	100%	1 (fixed)
Lookup Table yz Function Block (where yz = 01 to 9)	0 or lowest from 3yz6h ^(*)	100 or highest from 3yz6h ^(**)	3yz3h
Mathematical Function	4021h	4023h	4032h
Programmable Logic Function	0%	100%	1 (fixed)

Output Commanded Field Value	7230h	7322h	6302h
Output Feedback Field Value	7230h	7322h	6302h
Power Supply Measured	N/A	N/A	1 (fixed)
Processor Temperature Measured	N/A	N/A	1 (fixed)

(*) - Whichever value is smaller; (**) - Whichever value is larger

Table 17 – Scaling Limits per Control Source

As shown in Figure 11, the Output FV will be calculated based on the FV scaling selected. Since 7321h represents the value at or below the lowest control input received, it represents the minimum field value that will be applied at the output. Similarly, 7323h represents the maximum FV that will be applied.

While (7320h < 7322h) must always hold true, in order to get an inverse response (i.e. output decreases as the input increased), simply set 7321h higher than 7323h.

Enable and Override inputs have been mentioned several times already. By default, neither inputs are used (control sources are set to 0=Ignore), but they can be activated for safety interlocks or other more complex applications. Table 18 shows the options for object 2352h **AO Enable Response**.

Value	Meaning
0	Enable When On, Else Shutoff
1	Enable When On, Else Rampoff
2	Enable When Off, Else Shutoff
3	Enable When Off, Else Rampoff
4	Enable When On, Else Ramp To Min
5	Enable When On, Else Ramp To Max

Table 18 – Object 2352h AO Enable Response Options

Table 19 shows options for object 2362h **AO Override Response** respectively. In both cases, the default responses are bolded. When the override is applied, the output is driven to the value defined in object 2300h, **AO Override FV**.

Value	Meaning
0	Override When On
1	Override When Off

Table 19 – Object 2362h AO Override Response Options

When an input to the output block goes into an error condition, object 6340 **AO Fault Mode** determines how the output will respond, per Table 20. By default, the output will be driven to the value defined in object 7341h **AO Fault FV**.

Value	Meaning
0	Shutoff Output
1	Apply Fault Value
2	Hold Last Value

Table 20 – Object 6340 AO Fault Mode Options

The controller applies the logic shown in Figure 12 when evaluating what output FV to apply. Under normal conditions, i.e. when the control input is driving the output as shown in the green box, there are ramping objects that can be applied to soften the output response. Object 2330h **AO Ramp Up** and object 2331 **AO Ramp Down** are both millisecond numbers that define how long it will take to ramp from **AO Scaling 1 FV** to **AO Scaling 2 FV**.

Object 2380h **AO Output Frequency** allows for adjusting the frequency of the output in PWM output mode. In Frequency mode the same object is used to define fixed duty cycle for the output. Object 2381h **AO Frequency PWM Amplitude** is used to select amplitude of the output in Frequency, PWM, Digital and Mixed output modes as per Table 21.

Value	Meaning
0	5V amplitude
1	12V amplitude

Table 21 – Object 2381 AO Frequency PWM Amplitude Options

Figure 12 – Analog Output Logic Flowchart

In addition to the read-only mappable object 7330h **AO Output Field Value** (as represented by the green box above), there is another object 2370h **AO Feedback FV**, also read-only mappable. This object reflects the actual measured value at the output. It is also used to detect and flag an error if there is an open or short circuit at the output.

If object 2310h **AO Error Detect Enable** is set to TRUE, then the absolute value between the desired output FV (7330h) and the measured feedback (2370h) is compared to 2311h **AO Error Clear Hysteresis**. If the difference between the target and the actual exceeds the hysteresis value, then a fault is present. Since both open and short circuits read close to zero feedback, a signal is also sent to the processor whenever a short (to either GND or +Vcc) has occurred.

The controller will then flag an “Open Circuit” fault. If the flag stays active for the 2312h **AO Error Reaction Delay** time, then an appropriate EMCY message will be added to object 1003h **Pre-Defined Error Field**. The application will react to the EMCY message as defined by object 1029h **Error Behaviour** at the sub-index corresponding to an Input Fault. Refer to section 2.2.4 and 2.2.13 for more information about objects 1003h and 1029h, including the complete list of EMCY messages.

Once the absolute difference between the target and feedback FV comes back with the tolerance defined in 2311h, the error flag is cleared. This means that when the output is commanded off, the flags are automatically reset, since the target and feedback are now both zero.

1.5. Internal Function Block Control Source

The 2In 2Out Signal controller allows for internal function block sources to be selected from the list of the logical function blocks supported by the controller. As a result, any output from one function block can be selected as the control source for another. Keep in mind that not all options make sense in all cases, but the complete list of control sources is shown in Table 22.

Value	Meaning
0	Control Source Not Used (Ignored)
1	CANopen® Message (RPDO)
2	Analog Input Function Block
3	PID Control Function Block
4	Lookup Table Function Block
5	Programmable Logic Function Block
6	Mathematical Function Block
7	Constant Function Block
8	Inching Function Block
9	Output Commanded Field Value
10	Output Feedback Field Value
11	Power Supply Measured
12	Processor Temperature Measured

Table 22 – Control Source Options

In addition to a source, each control also has a number which corresponds to the sub-index of the function block in question. Table 23 outlines the ranges supported for the number objects, depending on the source that had been selected.

Control Source	Range	Object (Meaning)
Control Source Not Used	0	Ignored
CANopen® Message (RPDO)	1	7300h sub-index 1 or 6200h sub-index 1 bit 0
	2	7300h sub-index 2 or 6200h sub-index 1 bit 1
	3	2500h sub-index 1 (Extra Received PV 1)
	4	2500h sub-index 2 (Extra Received PV 2)
	5	2500h sub-index 3 (Extra Received PV 3)
	6	2500h sub-index 4 (Extra Received PV 4)
	7	2500h sub-index 5 (Extra Received PV 5)
	8	2500h sub-index 6 (Extra Received PV 6)

	9	2500h sub-index 7 (Extra Received PV 7)
	10	2500h sub-index 8 (Extra Received PV 8)
	11	2500h sub-index 9 (Extra Received PV 9)
	12	2500h sub-index 10 (Extra Received PV 10)
	13	2500h sub-index 11 (Extra Received PV 11)
	14	2500h sub-index 12 (Extra Received PV 12)
	15	2500h sub-index 13 (Extra Received PV 13)
	16	2500h sub-index 14 (Extra Received PV 14)
Analog Input Function Block	1	7100h sub-index 1 or 6000h sub-index 1 bit 0
	2	7100h sub-index 2 or 6000h sub-index 1 bit 1
Constant Function Block	1	5010h sub-index 1 (always FALSE)
	2	5010h sub-index 2 (always TRUE)
	3	5010h sub-index 3 (Constant FV 3)
	4	5010h sub-index 4 (Constant FV 4)
	5	5010h sub-index 5 (Constant FV 5)
	6	5010h sub-index 6 (Constant FV 6)
	7	5010h sub-index 7 (Constant FV 7)
	8	5010h sub-index 8 (Constant FV 8)
	9	5010h sub-index 9 (Constant FV 9)
	10	5010h sub-index 10 (Constant FV 10)
	11	5010h sub-index 11 (Constant FV 11)
	12	5010h sub-index 12 (Constant FV 12)

1.6. PID Function Block

Figure 13 – PID Control Objects

As with the output function block, the PID control function has control inputs associate with it that can be mapped to the output from any other function block. Objects 2453h **PID Target Source** and 2454h **PID Target Number** define what value the PID loop will attempt to maintain. For example, in the case of a setpoint (fixed) control application, this input can be mapped to one of object 5010h, a Constant FV. In this case, since there is no pre-defined range associated with a constant (see Table 17), the scaling limits will be set equal to those of the feedback input. Otherwise, the target input units do not have to match the feedback units, so long as they are scaled relative to one another.

Objects 2355h **PID Feedback Source** and 2356h **PID Feedback Number** define the close-loop input. Both the target and feedback use Table 22 and Table 23 as the available options. Both inputs are normalized to a percentage based on the associated scaling limits as defined in Table 17.

Object 2450h **PID Tolerance** defines the acceptable difference between the target and feedback, as a percentage, whereby an absolute difference smaller than this is treated as a 0% error.

Unless both the target and feedback inputs have legitimate control sources selected, the PID loop is disabled. When active, however, the PID algorithm will be called every 7456h **PID Cycle Time**, the default being every 10ms.

Object 6458h **PID Physical Unit Timing** is a read-only value and is defined in Seconds. The default value for object 6459h **PID Decimal Digits Timing** is 3, which means the object 7456h, along with other PID timing objects, are interpreted in milliseconds. Other time objects associated with the PID control are 7452h **PID Integral Action Time (Ti)** and 7454h **PID Derivative Action Time (Td)**.

None time related objects use a fixed resolution of 1 decimal digit. These objects include 7450h PID Proportional Band (G), 2450h PID Tolerance, 2451h PID Integral Gain (Ki), and 2454h PID Derivative Gain (Kd).

By default, the PID loop is assumed to be controlling a single output which will increase/decrease as the feedback over/undershoots the target. However, some systems may require a push-pull response where one output comes on when over target, and the other when under. Object 2457h PID Control Response allows the user to select the response profile as needed from Table 24.

Value	Meaning
0	Single Output
1	On When Over Target
2	On When Below Target

Table 24 – PID Control Response Options

The PID algorithm used is shown below, with names in red being the object variables. The result PIDOutput_k is written to the read-only mappable object 2460h **PID Output Field Value**, and is interpreted as a percentage value with 1 decimal place resolution. It can be used as the control source for another function block, i.e. one of the analog outputs.

```

T = Loop_Update_Rate*0.001

P_Gain = G
I_Gain = G*Ki*T/Ti
D_Gain = G*Kd*Td/T
Note: If Ti is zero, I_Gain = 0

Errork           = Target - Feedback
ErrorSumk = ErrorSumk-1 + Errork

Pk = Errork * P_Gain

Ik = ErrorSumk * I_Gain

Dk = (Errork-Errork-1) * D_Gain

PIDOutputk = Pk + Ik + Dk

```

Figure 14 – PID Control Algorithm

Each system will have to be tuned for the optimum output response. Response times, overshoots and other variables will have to be decided by the customer using an appropriate PID tuning strategy.

1.7. Lookup Table Function Block

The lookup table (LTz) function blocks are not used by default.

Figure 15 – Lookup Table Objects

Lookup tables are used to give an output response of up to 10 slopes per input. The array size of the objects 3yz5h **LTyz Point Response**, 3yz6h **LTyz Point X-Axis PV** and 3yz7h **Point Y-Axis PV** shown in the block diagram above is therefore 11.

Note: If more than 10 slopes are required, a Programmable Logic Block can be used to combine up to three tables to get 30 slopes, as is described in Section 1.8.

A parameter that will affect the function block is object 3yz5h **sub-index 1** which defines the "**X-Axis Type**". By default, the tables have a '*Data Response*' output (0). Alternatively, it can be selected as a '*Time Response*' (1).

There are two (or three) other key parameters that will affect how this function block will behave depending on the "**X-Axis Type**" chosen. If chosen '*Data Response*', then the objects 3yz0h **Lookup Table yz Input X-Axis Source** and 3yz1h **Lookup Table yz Input X-Axis Number** together define the control source for the function block. When it is changed, the table values in object 3yz6h need to be updated with new defaults based on the X-Axis source selected as described in Tables 15 and 16. If however, the "**X-Axis Type**" is chosen to be '*Time Response*', an additional parameter is taken into consideration - object 3yz2h, **Lookup Table yz Auto Repeat**. These will be described in more detail in Section 1.7.4.

1.7.1. X-Axis, Input Data Response

In the case where the “**X-Axis Type**” = ‘*Data Response*’, the points on the X-Axis represents the data of the control source.

The constraint on the X-Axis data is that the next index value is greater than or equal to the one below it, as shown in the equation below. Therefore, when adjusting the X-Axis data, it is recommended that X_{11} is changed first, then lower indexes in descending order.

$$\text{MinInputRange} \leq X_1 \leq X_2 \leq X_3 \leq X_4 \leq X_5 \leq X_6 \leq X_7 \leq X_8 \leq X_9 \leq X_{10} \leq X_{11} \leq \text{MaxInputRange}$$

As stated earlier, MinInputRange and MaxInputRange will be determined by the scaling objects associated with X-Axis Source that has been selected, as outlined in Figure 8.

1.7.2. Y-Axis, Lookup Table Output

By default, it is assumed that the output from the lookup table function block will be a percentage value in the range of 0 to 100.

In fact, so long as all the data in the Y-Axis is $0 \leq Y[i] \leq 100$ (where $i = 1$ to 11) then other function blocks using the lookup table as a control source will have 0 and 100 as the Scaling 1 and Scaling 2 values used in linear calculations shown in Table 17.

However, the Y-Axis has no constraints on the data that it represents. This means that inverse, or increasing/decreasing or other responses can be easily established. The Y-Axis does not have to be a percentage output, but could represent full scale process values instead.

In all cases, the controller looks at the entire range of the data in the Y-Axis sub-indexes, and selects the lowest value as the MinOutRange and the highest value as the MaxOutRange. So long as they are not both within the 0 to 100 range, they are passed directly to other function blocks as the limits on the lookup table output. (i.e. Scaling 1 and Scaling 2 values in linear calculations.)

Even if some of the data points are ‘*Ignored*’ as described in Section 1.7.3, they are still used in the Y-Axis range determination. If not all the data points are going to be used, it is recommended that Y10 be set to the minimum end of the range, and Y11 to the maximum first. This way, the user can get predictable results when using the table to drive another function block, such as an analog output.

1.7.3. Point to Point Response

By default, all six lookup tables have a simple linear response from 0 to 100 in steps of 10 for both the X and Y axes. For a smooth linear response, each point in the 30z5h **LTz Point Response** array is setup for a ‘*Ramp To*’ output.

Alternatively, the user could select a ‘*Step To*’ response for 30z4h, where $N = 2$ to 11. In this case, any input value between X_{N-1} to X_N will result in an output from the lookup table function block of Y_N . (Recall: LTz Point Response sub-index 1 defines the X-Axis type)

Figure 16 shows the difference between these two response profiles with the default settings.

Figure 16 – Lookup Table Defaults with Ramp and Step Responses

Lastly, any point except (1,1) can be selected for an ‘Ignore’ response. If **LTz Point Response sub-index N** is set to ignore, then all points from (X_N, Y_N) to (X_{11}, Y_{11}) will also be ignored. For all data greater than X_{N-1} , the output from the lookup table function block will be Y_{N-1} .

A combination of ‘Ramp To’, ‘Jump To’ and ‘Ignore’ responses can be used to create an application specific output profile. An example of where the same input is used as the X-Axis for two tables, but where the output profiles ‘mirror’ each other for a deadband joystick response is shown in Figure 17. The example shows a dual slope percentage output response for each side of the deadband, but additional slopes can be easily added as needed. (*Note: In this case, since the analog outputs are responding directly to the profile from the lookup tables, both would have object 2342h AO Control Response set to a ‘Single Output Profile.’*)

Figure A - Dual Slope "Profile B"
Joystick Deadband Response

Figure B - Dual Slope "Profile A"
Joystick Deadband Response

Figure 17 – Lookup Table Examples to Setup for Dual-Slope Joystick Deadband Response

To summarize, Table 25 outlines the different responses that can be selected for object 30z4h, both for the X-Axis type and for each point in the table.

Sub-Index	Value	Meaning
1	0	Data Response (X-Axis Type)
2 to 11		Ignore (this point and all following it)
1	1	Time Response (X-Axis Type)
2 to 11		Ramp To (this point)
1	2	N/A (not an allowed option)
2 to 11		Jump To (this point)

Table 25 – LTyz Point Response Options

1.7.4. X-Axis, Time Response

A lookup table can also be used to get a custom output response where the “**X-Axis Type**” is a ‘**Time Response**’. When this is selected, the X-Axis now represents time, in units of milliseconds, while the Y-Axis still represents the output of the function block.

With this response, the sequence will start depending on two parameters:

- **Lookup Table yz Input X-Axis Source** Object 3yz0h and;
- **Lookup Table yz Auto Repeat** Object 3yz2h

By default, the “Auto Repeat” object is set to FALSE (0). In this case, the lookup table will react in the following way:

The X-Axis control source is treated as a digital input. When the control input is ON, the output will be changed over a period of time based on the profile in the lookup table. Once the profile has finished (i.e. reached index 11, or an ‘Ignored’ response), the output will remain at the last output at the end of the profile until the control input turns OFF.

However, when the “Auto Repeat” object is set to TRUE (1), the lookup table will react in the following way:

When the control input is ON, the output will be changed over a period of time based on the profile in the lookup table. Once the profile has finished (i.e. reached index 11, or an ‘Ignored’ response), the lookup table will revert back to the first point in the table and Auto Repeat the sequence. This will continue for as long as the input remains ON. Once the input turns OFF, the lookup table sequence will stop and the output of the lookup table is zero.

Note: When the control input is OFF, the output is always at zero. When the input comes ON, the profile will **ALWAYS** start at position (X₁, Y₁) which is 0 output for 0ms.

In a time response, the data in object 30z6h **LTyz Point X-Axis PV** is measured in milliseconds, and object 3yz3h **LTyz X-Axis Decimal Digits PV** is automatically set to 0. A minimum value of 1ms must be selected for all points other than sub-index 1 which is automatically set to [0,0]. The interval time between each point on the X-axis can be set anywhere from 1ms to 24 hours.
[86,400,000 ms]

1.8. Programmable Logic Function Block

The programmable logic blocks (LB(3-x)) functions are not used by default.

Figure 18 – Logic Block Objects

This function block is obviously the most complicated of them all, but very powerful. Any LB_x (where X= 4 to 6) can be linked with up to three lookup tables, any one of which would be selected only under given conditions. Any three tables (of the available 6) can be associated with the logic, and which ones are used is fully configurable on object 3x01 LB(3-x) Lookup Table Number.

Should the conditions be such that a particular table (A, B or C) has been selected as described in Section 1.8.2, then the output from the selected table, at any given time, will be passed directly to LB(3-x)'s corresponding sub-index X in read-only mappable object 3320h Logic Block Output PV. The active table number can read from read-only object 3310h Logic Block Selected Table.

Note: In this document, the term LB(3-x) refers to Logic Blocks 1 to 2. Due to the CANopen® Object indices, Logic Block 1 begins at 3401h where x, in this case, is 4.

Therefore, an LB_x allows up to three different responses to the same input, or three different responses to different inputs, to become the control for another function block. Here, the "Control Source" for the reactive block would be selected to be the 'Programmable Logic Function Block,' as described in Section 1.8.2.

In order to enable any one of logic blocks, the corresponding sub-index in object 3300h Logic Block Enable must be set to TRUE. They are all disabled by default.

Logic is evaluated in the order shown in Figure 19. Only if a lower indexed table (A, B, C) has not been selected will the conditions for the next table be looked at. **The default table is always selected as soon as it is evaluated. It is therefore required that the default table always be the highest index in any configuration.**

Figure 19 – Logic Block Flowchart

1.8.1. Conditions Evaluation

The first step in determining which table will be selected as the active table is to first evaluate the conditions associated with a given table. Each table has associated with it up to three conditions that can be evaluated. Conditional objects are custom DEFSTRUCT objects defined as shown in Table 25.

Index	Sub-Index	Name	Data Type
3xyz*	0	Highest sub-index supported	UNSIGNED8
	1	Argument 1 Source	UNSIGNED8
	2	Argument 1 Number	UNSIGNED8
	3	Argument 2 Source	UNSIGNED8
	4	Argument 2 Number	UNSIGNED8
	5	Operator	UNSIGNED8

* Logic Block X Function Y Condition Z, where X = 4 to 7, Y = A, B or C, and Z = 1 to 3

Table 26 – LB(3-x) Condition Structure Definition

Objects 3x11h, 3x12h and 3x13h are the conditions evaluated for selecting Table A. Objects 3x21h, 3x22h and 3x23h are the conditions evaluated for selecting Table B. Objects 3x31h, 3x32h and 3x33h are the conditions evaluated for selecting Table C.

Argument 1 is always a logical output from another function block, as listed in Table 28. As always, the input is a combination of the functional block objects 3xyzh sub-index 1 “**Argument 1 Source**” and “**Argument 1 Number**.”

Argument 2 on the other hand, could either be another logical output such as with Argument 1, OR a constant value set by the user. To use a constant as the second argument in the operation, set “**Argument 2 Source**” to ‘Constant Function Block’, and “**Argument 2 Number**” to the desired sub-index. When defining the constant, make sure it uses the same resolution (decimal digits) as the Argument 1 input.

Argument 1 is evaluated against Argument 2 based on the “**Operator**” selected in sub-index 5 of the condition object. The options for the operator are listed in Table 27, and the default value is always ‘Equal’ for all condition objects.

Value	Meaning
0	=, Equal
1	!=, Not Equal
2	>, Greater Than
3	>=, Greater Than or Equal
4	<, Less Than
5	<=, Less Than or Equal

Table 27 – LB(3-x) Condition Operator Options

By default, both arguments are set to ‘Control Source Not Used’ which disables the condition, and automatically results in a value of N/A as the result. Although is generally considered that each condition will be evaluated as either TRUE or FALSE, the reality is that there could be four possible results, as described in Table 28.

Value	Meaning	Reason
0	False	(Argument 1) Operator (Argument 2) = False

1	True	(Argument 1) Operator (Argument 2) = True
2	Error	Argument 1 or 2 output was reported as being in an error state
3	Not Applicable	Argument 1 or 2 is not available (i.e. set to 'Control Source Not Used')

Table 28 – LB(3-x) Condition Evaluation Results

1.8.2. Table Selection

In order to, determine if a particular table will be selected, logical operations are performed on the results of the conditions as determined by the logic in Section 1.8.1. There are several logical combinations that can be selected, as listed in Table 29. The default value for object 3x02h **LB(3-x) Function Logical Operator** is dependent on the sub-index. For sub-index 1 (Table A) and 2 (Table B), the ‘Cnd1 And Cnd2 And Cnd3’ operator is used, whereas sub-index 3 (Table C) is setup as the ‘Default Table’ response.

Value	Meaning
0	Default Table
1	Cnd1 And Cnd2 And Cnd3
2	Cnd1 Or Cnd2 Or Cnd3
3	(Cnd1 And Cnd2) Or Cnd3
4	(Cnd1 Or Cnd2) And Cnd3

Table 29 – LB(3-x) Function Logical Operator Options

Not every evaluation is going to need all three conditions. The case given in the earlier section, for example, only has one condition listed, i.e. that the Engine RPM be below a certain value. Therefore, it is important to understand how the logical operators would evaluate an Error or N/A result for a condition, as outlined in Table 30.

Logical Operator	Select Conditions Criteria
Default Table	Associated table is automatically selected as soon as it is evaluated.
Cnd1 And Cnd2 And Cnd3	<p>Should be used when two or three conditions are relevant, and all must be True to select the table.</p> <p>If any condition equals False or Error, the table is not selected. An N/A is treated like a True. If all three conditions are True (or N/A), the table is selected.</p> <p>If((Cnd1==True) &&(Cnd2==True)&&(Cnd3==True)) Then Use Table</p>
Cnd1 Or Cnd2 Or Cnd3	<p>Should be used when only one condition is relevant. Can also be used with two or three relevant conditions.</p> <p>If any condition is evaluated as True, the table is selected. Error or N/A results are treated as False</p> <p>If((Cnd1==True) (Cnd2==True) (Cnd3==True)) Then Use Table</p>
(Cnd1 And Cnd2) Or Cnd3	<p>To be used only when all three conditions are relevant.</p> <p>If both Condition 1 and Condition 2 are True, OR Condition 3 is True, the table is selected. Error or N/A results are treated as False</p> <p>If(((Cnd1==True)&&(Cnd2==True)) (Cnd3==True)) Then Use Table</p>
(Cnd1 Or Cnd2) And Cnd3	<p>To be used only when all three conditions are relevant.</p>

	If Condition 1 And Condition 3 are True, OR Condition 2 And Condition 3 are True, the table is selected. Error or N/A results are treated as False If(((Cnd1==True) ((Cnd2==True)) && (Cnd3==True)) Then Use Table
--	--

Table 30 – LB(3-x) Conditions Evaluation Based on Selected Logical Operator

If the result of the function logic is TRUE, then the associated lookup table (see object 4x01h) is immediately selected as the source for the logic output. No further conditions for other tables are evaluated. For this reason, the '*Default Table*' should always be setup as the highest letter table being used (A, B or C). If no default response has been setup, the Table A automatically becomes the default when no conditions are true for any table to be selected. This scenario should be avoided whenever possible to not to result in unpredictable output responses.

The table number that has been selected as the output source is written to sub-index X of read-only object 4010h **Logic Block Selected Table**. This will change as different conditions result in different tables being used.

1.8.3. Logic Block Output

Recall that Table Y, where Y = A, B or C in the LB(3-x) function block does NOT mean lookup table 1 to 3. Each table has object 3x01h LB(3-x) **Lookup Table Number** which allows the user to select which lookup tables they want associated with a particular logic block. The default tables associated with each logic block are listed in Table 31.

Programmable Logic Block Number	Table A – Lookup Table Block Number	Table B – Lookup Table Block Number	Table C – Lookup Table Block Number
1	1	2	3
2	4	5	6

Table 31 – LB(3-x) Default Lookup Tables

If the associated Lookup Table YZ (where YZ equals 3310h sub-index X) does not have an "**X-Axis Source**" selected, then the output of LB(3-x) will always be "Not Available" so long as that table is selected. However, should LTyz be configured for a valid response to an input, be it Data or Time, the output of the LTyz function block (i.e. the Y-Axis data that has been selected based on the X-Axis value) will become the output of the LB(3-x) function block so long as that table is selected.

The LB(3-x) output is always setup as a percentage, based on the range of the Y-Axis for the associated table (see Section 1.7.2) It is written to sub-index X of read-only object 3320h **Logic Block Output PV** with a resolution of 1 decimal place.

1.9. Math Function Block

There are four mathematic function blocks that allow the user to define basic algorithms. Math function block Z = 1 to 4 will be enabled based on sub-index Z in object 4000h **Math Enable**.

Figure 20 – Math Function Block Objects

A math function block can take up to four input signals, as listed in Figure 2 in Section 1. Each input is then scaled according the associated scaling and gain objects. A “Math Input X” is determined by the corresponding sub-index $X = 1$ to 4 of the objects **4y00h Math Y Input Source** and **4y01h Math Y Input Number**. Here, $y = 1$ to 4 ; corresponding the Math 1- Math 4.

Inputs are converted into a percentage value based on objects **4y20h Math Y Scaling 1 FV** and **4y22h Math Y Scaling 2 FV**. Before being used in the calculation, these objects apply the resolution shift defined by object **4y02h Math Y Decimal Digits FV**. As with any other function block using a control source for the X-Axis in a conversion, the scaling objects should be selected to match the values in the control’s corresponding objects as per Table 17.

For additional flexibility, the user can also adjust object **4y40h Math Y Input Gain**. This object has a fixed decimal digit resolution of 2, and a range of -100 to 100. By default, each input has a gain of 1.0.

For each input pair, the appropriate arithmetic or logical operation is performed on the two inputs, InA and InB, according the associated function in sub-index of InB in object **4y50h Math Y Operator**. The list of selectable function operations is defined in Table 32.

0	=	True when InA Equals InB
1	!=	True when InA Not Equal InB
2	>	True when InA Greater Than InB
3	>=	True when InA Greater Than or Equal InB
4	<	True when InA Less Than InB
5	<=	True when InA Less Than or Equal InB
6	OR	True when InA or InB is True

7	AND	True when InA and InB are True
8	XOR	True when InA/InB is True, but not both
9	+	Result = InA plus InB
10	-	Result = InA minus InB
11	x	Result = InA times InB
12	/	Result = InA divided by InB
13	MIN	Result = Smallest of InA and InB
14	MAX	Result = Largest of InA and InB

Table 32 – Object 4y50h Math Function Operators

For Function 1, InA and InB are Math Inputs 1 and 2, respectively.

For Function 2, InA is the result of Function 2 and InB is Math Input 3, respectively.

For Function 3, InA is the result of Function 3 and InB is Math Input 4, respectively.

For a valid result in each Function, both inputs must be non-zero value (other than ‘*Control Source Not Used*’). Otherwise, the corresponding Function is ignored, and the “Output Data” for the math function block is the result of the earlier function scaled according to the output objects. For example, if Math Input 4 is not used, the math output would be the result of the Function 3 operation.

For logical operators (6 to 8), any SCALED input greater than or equal to 0.5 is treated as a TRUE input. For logic output operators (0 to 8), the result of the calculation for the function will always be 0 (FALSE) or 1 (TRUE).

Error data (i.e. input measured out of range) is always treated as a 0.0 input into the function.

For the arithmetic functions (9 to 14), it is recommended to scale the data such that the resulting operation will not exceed full scale (0 to 100%) and saturate the output result.

When dividing, a zero InB value will always result in a zero output value for the associated function. When subtracting, a negative result will always be treated as a zero, unless the function is multiplied by a negative one, or the inputs are scaled with a negative coefficient first.

The resulting final mathematical output calculation is in the appropriate physical units using object 4021h **Math Output Scaling 1 PV** and 4023h **Math Output Scaling 2 PV**. These objects are also considered the Min and Max values of the Math Block output and apply the resolution shift defined by object 4032h **Math Output Decimal Digits PV**. The result is written to read-only object 4030h **Math Output PV**. These scaling objects should also be taken into account when the Math Function is selected as the input source for another function block, as outlined in Table 17.

1.10. Miscellaneous Function Block

There are some other objects available which have not yet been discussed, or mentioned briefly in passing (i.e. constants.) These objects are not necessarily associated with one another, but are all discussed here.

Figure 21 – Miscellaneous Objects

Extra RPDO Messages

Objects 2500h **Extra Control Received PV**, 2502h **EC Decimal Digits PV**, 2502h **EC Scaling 1 PV** and **EC Scaling 2 PV** are mentioned in Section 1.4, Table 17. These objects allow for additional data received on a CANopen® RPDO to be mapped independently to various function blocks as a control source. The scaling objects are provided to define the limits of the data when it is used by another function block, as shown in Table 17.

Constant Values

Object 5010h **Constant Field Value** is provided to give the user the option for a fixed value that can be used by other function blocks. Sub-index 1 is fixed as FALSE (0) and sub-index 2 is always TRUE (1). There are 13 other sub-indexes provided for user selectable values.

The constants are read as 32-bit real (float) data, so no decimal digit object is provided. When setting up the constant, make sure to do it with the resolution of the object that will be compared with it.

The False/True constants are provided primarily to be used with the logic block. The variable constants are also useful with the logic or math blocks.

Fault Detection Objects

Object 5040h **FD Field Value** is a read only object containing the field values of the over temperature, over and under voltage. Object 5041h **FD Set Threshold** sets the limit values for which the faults occur when reached. When any of these thresholds are reached, the faults will clear when the values have lowered to values set in object 5042h **FD Clear Threshold**.

For the 2IN-2OUT-SIG-CO controller to begin monitoring fault detections, object 5050h **Error Check Detection** determines which Fault Detection is enabled through 1 byte data as bits. Once a fault is detected, object 5051h **Error Response Delay** will determine how long the fault needs to be present to flag an error.

Automatic Update of Objects

Object 5550h **Enable Automatic Updates** allows for the controller to automatically update the objects related to the input to defaults when it is changed. By default, this object is set to TRUE, in which case the objects are set to their default values depending on the type selected.

On the other hand, when this object is FALSE, the objects are not set to defaults and are left with the same values previous to changing the type. In this case, these are to be configured manually.

Startup

The last object 5555h **Start in Operational** is provided as a ‘cheat’ when the unit is not intended to work with a CANopen® network (i.e. a stand-alone control), or is working on a network comprised solely as slaves so the OPERATION command will never be received from a master. By default, this object is disabled (FALSE).

When using the 2IN-2OUT-SIG-CO as a stand-alone controller where 5555h is set to TRUE, it is recommended to disable all TPDOs (set the Event Timer to zero) so that it does not run with a continuous CAN error when not connected to a bus.

1.11. Inching Control Block

Figure 22 – Inching Function Block Objects

The Inching Control Block provides fast and easy setup to control output with dual input. The Inching Control Block has two selectable inputs: Increasing Input, selected with Object 2610h **INCH Increment Input Source** and Object 2611h **INCH Increment Input Numbers**, and Decreasing Input, selected with Object 2620h **INCH Decrement Input Source** and Object 2621h **INCH Decrement Input Number**. Both inputs of the block are digital, thus when a non-digital signal is selected as an input it is interpreted in a manner described in section 1.1.

The Control implements a xor logic, where output value increases when incrementing input is ON, decreases when decreasing input is ON and is held in current value while both inputs are ON or OFF, as shown in Table 33. Output of the control block is a value between 0 and 100 (%).

Increasing Input	Decreasing Input	Output
OFF	OFF	HOLD
ON	OFF	INCREASE
OFF	ON	DECREASE
ON	ON	HOLD

Table 33 – Inching Control Logic

Each input has a selectable mode that defines how the control block output responses when an input is ON. In ‘Ramp’ mode the output continuously ramps increasing towards maximum (100) or ramps decreasing towards minimum (0), while an input signal is ON. In ‘Notch’ mode the output increases by a set notch value, or decreases by a set notch value, when an input signal state changes from OFF to ON. The modes are selected with Object 2612h **INCH Increment Response**

and Object 2622h **INCH Decrement Response**. Ramp times are defined with Object 2613h **INCH Increment Ramp** and Object 2623h **INCH Decrement Ramp**. And notch values are set with Object 2614h **INCH Increment Notch** and Object 2624h **INCH Decrement Notch**.

Value	Meaning
0	<i>Ramp</i>
1	<i>Notch</i>

Table 34 – Inc Response and Dec Response Options

After a power cycle, enabled Inch Control Block output holds the value set with Object 2601h **INCH Start Value** until input turns ON. Inch Control block is enabled by setting Object 2600h **INCH Control Enabled** value to 1.

2. CANOPEN® OBJECT DICTIONARY

The CANopen® object dictionary of the 2IN-2OUT-SIG-CO Controller is based on CiA device profile DS-404 V1.2 (device profile for measurement devices and Closed Loop Controllers). The object dictionary includes Communication Objects beyond the minimum requirements in the profile, as well as several manufacturer-specific objects for extended functionality.

2.1. Node ID and Baudrate

By default, the 2IN-2OUT-SIG-CO Controller ships factory programmed with a Node ID = 127 (0x7F) and with Baudrate = 125 kbps.

2.1.1. LSS Protocol to Update

The only means by which the Node-ID and Baudrate can be changed is to use Layer Settling Services (LSS) and protocols as defined by CANopen® standard DS-305.

Follow the steps below to configure either variable using LSS protocol. If required, please refer to the standard for more detailed information about how to use the protocol

2.1.1.1. Setting Node-ID

- Set the module state to LSS-configuration by **sending** the following message:

Item	Value
COB-ID	0x7E5
Length	2
Data 0	0x04 (cs=4 for switch state global)
Data 1	0x01 (switches to configuration state)

- Set the Node-ID by **sending** the following message:

Item	Value
COB-ID	0x7E5
Length	2
Data 0	0x11 (cs=17 for configure node-id)
Data 1	Node-ID (set new Node-ID as a hexadecimal number)

- The module will send the following response (any other response is a failure).

Item	Value
COB-ID	0x7E4
Length	3
Data 0	0x11 (cs=17 for configure node-id)
Data 1	0x00
Data 2	0x00

- Save the configuration by **sending** the following message:

Item	Value
COB-ID	0x7E5
Length	1
Data 0	0x17 (cs=23 for store configuration)

- The module will send the following response (any other response is a failure)

Item	Value
COB-ID	0x7E4
Length	3
Data 0	0x17 (cs=23 for store configuration)
Data 1	0x00
Data 2	0x00

- Set the module state to LSS-operation by **sending** the following message: (Note, the module will reset itself back to the pre-operational state)

Item	Value
COB-ID	0x7E5
Length	2
Data 0	0x04 (cs=4 for switch state global)
Data 1	0x00 (switches to waiting state)

2.1.1.2. Setting Baudrate

- Set the module state to LSS-configuration by sending the following message:

Item	Value
COB-ID	0x7E5
Length	2
Data 0	0x04 (cs=4 for switch state global)
Data 1	0x01 (switches to configuration state)

- Set the baudrate by sending the following message:

Item	Value
COB-ID	0x7E5
Length	3
Data 0	0x13 (cs=19 for configure bit timing parameters)
Data 1	0x00 (switches to waiting state)
Data 2	Index (select baudrate index per Table 32)

Index	Bit Rate
0	1 Mbit/s
1	800 kbit/s
2	500 kbit/s
3	250 kbit/s
4	125 kbit/s (default)
5	reserved (100 kbit/s)

6	50 kbit/s
7	20 kbit/s
8	10 kbit/s

Table 35 – LSS Baudrate Indices

- The module will send the following response (any other response is a failure):

Item	Value
COB-ID	0x7E4
Length	3
Data 0	0x13 (cs=19 for configure bit timing parameters)
Data 1	0x00
Data 2	0x00

- Activate bit timing parameters by sending the following message:

Item	Value
COB-ID	0x7E5
Length	3
Data 0	0x15 (cs=19 for activate bit timing parameters)
Data 1	<delay_lsb>
Data 2	<delay_ms>

The delay individually defines the duration of the two periods of time to wait until the bit timing parameters switch is done (first period) and before transmitting any CAN message with the new bit timing parameters after performing the switch (second period). The time unit of switch delay is 1 ms.

- Save the configuration by sending the following message (on the NEW baudrate):

Item	Value
COB-ID	0x7E5
Length	1
Data 0	0x17 (cs=23 for store configuration)

- The module will send the following response (any other response is a failure):

Item	Value
COB-ID	0x7E4
Length	3
Data 0	0x17 (cs=23 for store configuration)
Data 1	0x00
Data 2	0x00

- Set the module state to LSS-operation by sending the following message: (Note, the module will reset itself back to the pre-operational state)

Item	Value
COB-ID	0x7E5
Length	2

Data 0	0x04	(cs=4 for switch state global)
Data 1	0x00	(switches to waiting state)

The following screen capture (left) shows the CAN data was sent (7E5h) and received (7E4h) by the tool when the baudrate was changed to 250 kbps using the LSS protocol. The other image (right) shows what was printed on an example debug RS-232 menu while the operation took place.

Between CAN Frame 98 and 99, the baudrate on the CAN Scope tool was changed from 125 to 250 kbps.

2.2. Communication Objects (DS-301 and DS-404)

The communication objects supported by the 2IN-2OUT-SIG-CO Controller are listed in the following table. A more detailed description of some of the objects is given in the following subchapters. Only those objects that have device-profile specific information are described. For more information on the other objects, refer to the generic CANopen® protocol specification DS-301.

Index (hex)	Object	Object Type	Data Type	Access	PDO Mapping
1000	Device Type	VAR	UNSIGNED32	RO	No
1001	Error Register	VAR	UNSIGNED8	RO	No
1002	Manufacturer Status Register	VAR	UNSIGNED32	RO	No
1003	Pre-Defined Error Field	ARRAY	UNSIGNED32	RO	No
100C	Guard Time	VAR	UNSIGNED16	RW	No
100D	Life Time Factor	VAR	UNSIGNED8	RW	No
1010	Store Parameters	ARRAY	UNSIGNED32	RW	No

1011	Restore Default Parameters	ARRAY	UNSIGNED32	RW	No
1016	Consumer Heartbeat Time	ARRAY	UNSIGNED32	RW	No
1017	Producer Heartbeat Time	VAR	UNSIGNED16	RW	No
1018	Identity Object	RECORD		RO	No
1020	Verify Configuration	ARRAY	UNSIGNED32	RO	No
1029	Error Behaviour	ARRAY	UNSIGNED8	RW	No
1400	RPDO1 Communication Parameter	RECORD		RW	No
1401	RPDO2 Communication Parameter	RECORD		RW	No
1402	RPDO3 Communication Parameter	RECORD		RW	No
1403	RPDO4 Communication Parameter	RECORD		RW	No

1A04	TPDO5 Mapping Parameter	RECORD		RW	No
1A05	TPDO6 Mapping Parameter	RECORD		RW	No

2.2.1. Object 1000h: Device Type

This object contains information about the device type as per device profile DS-404. The 32-bit parameter is divided into two 16-bit values, showing General and Additional information as shown below.

MSB	LSB
Additional Information = 0xE01F	General Information = 0x0194 (404)

DS-404 defines the Additional Information field in the following manner:

- 0000h = reserved
- 0001h = digital input block
- 0002h = analog input block
- 0004h = digital output block
- 0008h = analog output block
- 0010h = controller block (aka PID)
- 0020h = alarm block
- 0040h ... 0800h = reserved
- 1000h = reserved
- 2000h = lookup table block (manufacturer-specific)

4000h = programmable logic block (manufacturer-specific)
8000h = miscellaneous block (manufacturer-specific)

Object Description

Index	1000h
Name	Device Type
Object Type	VAR
Data Type	UNSIGNED32

Entry Description

Access	RO
PDO Mapping	No
Value Range	0xE01F0194
Default Value	0xE01F0194

2.2.2. Object 1001h: Error Register

This object is an error register for the device. Any time there is an error detected by the 2IN-2OUT-SIG-CO Controller, the Generic Error Bit (bit 0) is set. Only if there are no errors in the module will this bit will be cleared. No other bits in this register are used by the 2IN-2OUT-SIG-CO Controller.

Object Description

Index	1001h
Name	Error Register
Object Type	VAR
Data Type	UNSIGNED8

Entry Description

Access	RO
PDO Mapping	No
Value Range	00h or 01h
Default Value	0

2.2.3. Object 1002h: Manufacturer Status Object

This object is used for manufacturer debug purposes.

2.2.4. Object 1003h: Pre-Defined Error Field

This object provides an error history by listing the errors in the order that they have occurred. An error is added to the top of the list, when it occurs, and is immediately removed when the error condition has been cleared. The latest error is always at sub-index 1, with sub-index 0 containing the number of errors currently in the list. When the device is in an error-free state, the value of sub-index 0 is zero.

The error list may be cleared by writing a zero to sub-index 0, which will clear all errors from the list, regardless of whether or not they are still present. Clearing the list does NOT mean that the module will return to the error-free behavior state if at least one error is still active.

The 2IN-2OUT-SIG-CO Controller has a limitation of a maximum of 4 errors in the list. If the device registers more errors, the list will be truncated, and the oldest entries will be lost.

The error codes stored in the list are 32-bit unsigned numbers, consisting of two 16-bit fields. The lower 16-bit field is the EMCY error code, and the higher 16-bit field is a manufacturer-specific code. The manufacturer-specific code is divided into two 8-bit fields, with the higher byte indicating the error description, and the lower byte indicating the channel on which the error occurred.

MSB		LSB
Error Description	Channel-ID	EMCY Error Code

If node-guarding is used (not recommended per the latest standard) and a lifeguard event occurs, the manufacturer-specific field will be set to 0x1000. On the other hand, if a heartbeat consumer fails to be received within the expected timeframe, the Error Description will be set to 0x80 and the Channel-ID (nn) will reflect the Node-ID of the consumer channel that was not producing. In this case, the manufacturer-specific field will therefore be 0x80nn. In both cases, the corresponding EMCY Error Code will be the Guard Error 0x8130.

If an RPDO is not received within the expected “Event Timer” period, an RPDO timeout will be flagged. Table 36 outlines the resulting Error Field Codes and their meanings.

Error Field Code	Error Description	Meaning	ID	Meaning	EMCY Code	Meaning
00000000h	EMCY Error Reset (fault no longer active)					
1001F001h	10h	Positive Overload (Out-of-range High)	01h	Magnetic Pickup	F001h	Input Overload
2001F001h	20h	Negative Overload (Out-of-range Low)	01h	Magnetic Pickup	F001h	Input Overload
10003100h	10h	Positive Overload (Vps Overvoltage)	00h	Unspecified	3100h	Device Voltage
20003100h	20h	Negative Overload (Vps Undervoltage)	00h	Unspecified	3100h	Device Voltage
10004200h	10h	Positive Overload (Over Temp)	00h	Unspecified	4200h	Device Temperature
00008100h	00h	RPDO Timeout	00h	Unspecified	8100h	Communication - generic
10008130h	10h	Lifeguard Event	00h	Unspecified	8130h	Lifeguard/Heartbeat Error
80nn8130h	80h	Heartbeat Timeout	nn	Node-ID	8130h	Lifeguard/Heartbeat Error
00008140h	00h	Bus OFF Event	00h	Unspecified	8400h	Bus OFF Recovery

Table 36 – Pre-Defined Error Field Codes

Access	RO
PDO Mapping	No
Value Range	UNSIGNED32
Default Value	0

2.2.5. Object 100Ch: Guard Time

The objects at index 100Ch and 100Dh shall indicate the configured guard time respective to the life time factor. The life time factor multiplied with the guard time gives the life time for the life guarding protocol described in DS-301. The Guard Time value shall be given in multiples of ms, and a value of 0000h shall disable the life guarding.

It should be noted that this object, and that of 100Dh are only supported for backwards compatibility. The standard recommends that newer networks do not use the life guarding protocol, but rather heartbeat monitoring instead. Both life guarding and heartbeats can NOT be active simultaneously.

Object Description

Index	100Ch
Name	Guard Time
Object Type	VAR
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Access	RW
PDO Mapping	No
Value Range	0 to 65535
Default Value	0

2.2.6. Object 100Dh: Lifetime Factor

The life time factor multiplied with the guard time gives the life time for the life guarding protocol. A value of 00h shall disable life guarding.

Object Description

Index	100Dh
Name	Life time factor
Object Type	VAR
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Access	RW
PDO Mapping	No
Value Range	0 to 255
Default Value	0

2.2.7. Object 1010h: Store Parameters

This object supports the saving of parameters in non-volatile memory. In order to avoid storage of parameters by mistake, storage is only executed when a specific signature is written to the appropriate sub-index. The signature is “save”.

The signature is a 32-bit unsigned number, composed of the ASCII codes of the signature characters, according to the following table:

MSB		LSB	
e	v	a	s
65h	76h	61h	73h

On reception of the correct signature to an appropriate sub-index, the 2IN-2OUT-SIG-CO Controller will store the parameters in non-volatile memory, and then confirm the SDO transmission.

By read access, the object provides information about the module’s saving capabilities. For all sub-indexes, this value is 1h, indicating that the 2IN-2OUT-SIG-CO Controller saves parameters on command. **This means that if power is removed before the Store object is written, changes to the Object Dictionary will NOT have been saved in the non-volatile memory, and will be lost on the next power cycle.**

Object Description

Index	1010h
Name	Store Parameters
Object Type	ARRAY
Data Type	UNSIGNED32

Value Range	0x65766173 (write access) 1h (read access)
Default Value	1h

2.2.8. Object 1011h: Restore Parameters

This object supports the restoring of the default values for the object dictionary in non-volatile memory. In order to avoid restoring of parameters by mistake, the device restores the defaults only when a specific signature is written to the appropriate sub-index. The signature is “load”.

The signature is a 32-bit unsigned number, composed of the ASCII codes of the signature characters, according to the following table:

MSB	LSB
d	o
64h	6Fh

On reception of the correct signature to an appropriate sub-index, the 2IN-2OUT-SIG-CO Controller will restore the defaults in non-volatile memory, and then confirm the SDO transmission. **The default values are set valid only after the device is reset or power-cycled.** This means that the 2IN-2OUT-SIG-CO Controller will NOT start using the default values right away, but rather continue to run from whatever values were in the Object Dictionary prior to the restore operation.

By read access, the object provides information about the module’s default parameter restoring capabilities. For all sub-indexes, this value is 1h, indicating that the 2IN-2OUT-SIG-CO Controller restores defaults on command.

Object Description

PDO Mapping	No
Value Range	0x64616F6C (write access), 1h (read access)
Default Value	1h

2.2.9. Object 1016h: Consumer Heartbeat Time

The 2IN-2OUT-SIG-CO Controller can be a consumer of heartbeat objects for a single module. This object defines the expected heartbeat cycle time for that module, and if set to zero, it is not used. When the object is non-zero, the time is a multiple of 1ms, and monitoring will start after the reception of the first heartbeat from the module. If the 2IN-2OUT-SIG-CO Controller fails to receive a heartbeat from a node in the expected timeframe, it will indicate a communication error, and respond as per object 1029h.

Bits	31-24	23-16	15-0
Value	Reserved 00h	Node-ID	Heartbeat time

Default Value	No

2.2.12.Object 1020h: Verify Configuration

This object can be read to see what date the software (version identified in object 1018h) was compiled. The date is represented as a hexadecimal value showing day/month/year as per the format below. The time value at sub-index 2 is a hexadecimal value showing the time in a 24 hour clock

MSB		LSB
Day (in 1-Byte Hex)	Month (in 1-Byte Hex)	Year (in 2-Byte Hex) Time (in 2-Byte Hex)

For example, a value of 0x30042014 would indicate that the software was compiled on April 30th, 2014. A time value of 0x00001842 would indicate it was compiled at 6:42pm.

Object Description

Value Range	UNSIGNED32
Default Value	No

2.2.13 Object 1029h: Error Behavior

This object controls the state that the 2IN-2OUT-SIG-CO Controller will be set into in case of an error of the type associated with the sub-index.

A network fault is flagged when an RPDO is not received within the expected time period defined in the “Event Timer” of the associated communication objects, (see Section 2.2.14 for more information) or if a lifeguard or heartbeat message is not received as expected. Input faults are defined in Section 1.1, and Power Supply faults are described in Section 1.10.

For all sub-indexes, the following definitions hold true:

- | | |
|---------------------|---|
| 0 = Pre-Operational | (node reverts to a pre-operational state when this fault is detected) |
| 1 = No State Change | (node remains in the same state it was in when the fault occurred) |
| 2 = Stopped | (node goes into stopped mode when the fault occurs) |

Object Description

Index	1029h
Name	Error Behaviour
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Number of entries
Access	RO
PDO Mapping	No
Value Range	0 to 6
Default Value	6

Sub-Index	1h
Description	Communication Fault
Access	RW

PDO Mapping	No
Value Range	See above
Default Value	0 (Pre-Operational)

Sub-Index	2h
Description	Digital Input Error
Access	RW
PDO Mapping	No
Value Range	See above
Default Value	1 (No State Change)

Sub-Index	3h
Description	Analog Input Error
Access	RW
PDO Mapping	No
Value Range	See above
Default Value	1 (No State Change)

Sub-Index	4h
Description	Digital Output Error
Access	RW
PDO Mapping	No
Value Range	See above
Default Value	1 (No State Change)

Sub-Index	5h
Description	Analog Output Error
Access	RW
PDO Mapping	No
Value Range	See above
Default Value	1 (No State Change)

Sub-Index	6h
Description	Fault Detection Error
Access	RW
PDO Mapping	No
Value Range	See above
Default Value	0 (Pre-Operational)

2.2.14.RPDO Behavior

Per the CANopen® standard DS-301, the following procedure shall be used for re-mapping, and is the same for both RPDOs and TPDOs.

- Destroy the PDO by setting bit **exists** (most significant bit) of sub-index 01h of the according PDO communication parameter to 1b
- Disable mapping by setting sub-index 00h of the corresponding mapping object to 0
- Modify the mapping by changing the values of the corresponding sub-indices
- Enable mapping by setting sub-index 00h to the number of mapped objects

- e) Create the PDO by setting bit **exists** (most significant bit) of sub-index 01h of the according PDO communication parameter to 0b

The 2IN-2OUT-SIG-CO Controller can support up to six RPDO messages. All RPDOs on the 2IN-2OUT-SIG-CO Controller use the similar default communication parameters, with the PDO IDs set according to the pre-defined connection set described in DS-301. Most RPDOs do not exist, there is no RTR allowed, they use 11-bit CAN-IDs (base frame valid) and they are all event-driven. While all six have valid default mappings defined (see below) only RPDO1 is enabled by default (i.e. RPDO exists).

RPDO1 Mapping at Object 1600h: Default ID 0x200 + Node ID

Sub-Index	Value	Object
0	4	Number of mapped application objects in PDO
1	0x73000110	AO1 Output Process Value PV
2	0x73000210	AO2 Output Process Value PV
3	0x25000110	Extra Received 1 PV
4	0x25000210	Extra Received 2 PV

RTPDO2 Mapping at Object 1601h: Default ID 0x300 + Node ID

Sub-Index	Value	Object
0	4	Number of mapped application objects in PDO
1	0x25000310	Extra Received 3 PV
2	0x25000410	Extra Received 4 PV
3	0x25000510	Extra Received 5 PV
4	0x25000610	Extra Received 6 PV

RPDO3 Mapping at Object 1602h: Default ID 0x400 + Node ID

Sub-Index	Value	Object
0	4	Number of mapped application objects in PDO
1	0x25000710	Extra Received 7 PV
2	0x25000810	Extra Received 8 PV
3	0x25000910	Extra Received 9 PV
4	0x25000A10	Extra Received 10 PV

RPDO4 Mapping at Object 1603h: Default ID 0x500 + Node ID

Sub-Index	Value	Object
0	4	Number of mapped application objects in PDO
1	0x25000B10	Extra Received 11 PV
2	0x25000C10	Extra Received 12 PV
3	0x25000D10	Extra Received 13 PV
4	0x25000E10	Extra Received 14 PV

None of them have the timeout feature enabled, i.e. the “Event Timer” on sub-index 5 is set to zero. When this is changed to a non-zero value, if the RPDO has not been received from another node within the time period defined (while in Operational mode), a network fault is activated, and the controller will go to the operational state define in Object 1029h sub-index 4.

Object Description

Index	1400h to 1403h
Name	RPDO communication parameter
Object Type	RECORD
Data Type	PDO Communication Record

Entry Description

Sub-Index	0h
Description	Number of entries
Access	RO
PDO Mapping	No
Value Range	5
Default Value	5

Sub-Index	1h
Description	COB-ID used by RPDO
Access	RW
PDO Mapping	No
Value Range	See value definition in DS-301
Default Value	40000000h + RPDO1 + Node ID C0000000h + RPDOx + Node-ID

X	RPDOx ID
1	0200h
2	0300h
3	0400h
4	0500h

Node-ID = Node-ID of the module. The RPDO COB-IDs are automatically updated if the Node-ID is changed by LSS protocol.

80000000h in the COB-ID indicates that the PDO does not exist (destroyed)

40000000h in the COB-ID indicates that there is no RTR allowed on the PDO

Sub-Index	2h
Description	Transmission type
Access	RO
PDO Mapping	No
Value Range	See value definition in DS-301
Default Value	255 (FFh) = Event Driven

Sub-Index	3h
Description	Inhibit Time
Access	RW
PDO Mapping	No
Value Range	See value definition in DS-301
Default Value	0

Sub-Index	4h
Description	Compatibility entry
Access	RW
PDO Mapping	No
Value Range	UNSIGNED8
Default Value	0

Sub-Index	5
Description	Event-timer
Access	RW
PDO Mapping	No
Value Range	See value definition in DS-301
Default Value	0

Recall: A non-zero event timer for an RPDO means that it will result in a network fault being flagged if it has not been received within this timeframe while in Operational mode.

2.2.15.TPDO Behavior

The 2IN-2OUT-SIG-CO Controller can support up to eight TPDO messages. All TPDOs on the 2IN-2OUT-SIG-CO Controller use the similar default communication parameters, with the PDO IDs set according to the pre-defined connection set described in DS-301. Most TPDOs do not exist, there is no RTR allowed, they use 11-bit CAN-IDs (base frame valid) and they are all time-driven. While, all have valid default mappings defined (see below), only TPDO1 to TPDO3 are enabled by default (i.e. TPDO exists).

TPDO1 Mapping at Object 1A00h: Default ID 0x180 + Node ID

Sub-Index	Value	Object
0	2	Number of mapped application objects in PDO
1	0x71000110	Universal Input 1 Field Value
2	0x71000210	Universal Input 2 Field Value
3	0	Not used by default
4	0	Not used by default

TPDO2 Mapping at Object 1A01h: Default ID 0x280 + Node ID

Sub-Index	Value	Object
0	2	Number of mapped application objects in PDO
1	0x23700110	AO1 Output Feedback Field Value
2	0x23700210	AO2 Output Feedback Field Value
3	0	Not used by default
4	0	Not used by default

TPDO3 Mapping at Object 1A02h: Default ID 0x380 + Node ID

Sub-Index	Value	Object
0	2	Number of mapped application objects in PDO
1	0x50400120	Processor Temperature Field Value (measured)
2	0x50400220	Power Supply Field Value (measured)
3	0	Not used by default
4	0	Not used by default

TPDO4 Mapping at Object 1A03h: Default ID 0x480 + Node ID

Sub-Index	Value	Object
0	0	Number of mapped application objects in PDO
1	0	Not used by default
2	0	Not used by default

3	0	Not used by default
4	0	Not used by default

Since only TPDO1 and TPDO2 has a non-zero value transmission rate (i.e. Event Timer in sub-index 5 of communication object), only these TPDOs will be automatically broadcasted when the unit goes into OPERATIONAL mode.

Object Description

Index	1800h to 1805h
Name	TPDO communication parameter
Object Type	RECORD
Data Type	PDO Communication Record

Entry Description

Sub-Index	0h
Description	Number of entries
Access	RO
PDO Mapping	No
Value Range	5
Default Value	5

Sub-Index	1h
Description	COB-ID used by TPDO
Access	RW
PDO Mapping	No
Value Range	See value definition in DS-301
Default Value	40000000h + TPDOx + Node-ID C0000000h + TPDOy + Node-ID

X	TPDOx ID
1	0180h
2	0280h
3	0380h
4	0480h

Node-ID = Node-ID of the module. The TPDO COB-IDs are automatically updated if the Node-ID is changed by LSS protocol.

80000000h in the COB-ID indicates that the PDO does not exist (destroyed)

40000000h in the COB-ID indicates that there is no RTR allowed on the PDO

Sub-Index	2h
Description	Transmission type
Access	RO
PDO Mapping	No
Value Range	See value definition in DS-301
Default Value	254 (FEh) = Event Driven

Sub-Index	3h
Description	Inhibit Time
Access	RW
PDO Mapping	No
Value Range	See value definition in DS-301
Default Value	0

Sub-Index	4h
Description	Compatibility entry
Access	RW

PDO Mapping	No
Value Range	UNSIGNED8
Default Value	0

Sub-Index	5
Description	Event-timer
Access	RW
PDO Mapping	No
Value Range	See value definition in DS-301
Default Value	100ms (on TPDO1, TPDO2) 0ms (on TPDO3, TPDO4)

2.3. Application Objects (DS-404)

2.3.1. Object 6000: DI Read State 8 Input Lines

This read-only object shall read group of 8 input lines as 8-bit information. Refer to Section 1.1 for more information

Object Description

Index	6000h
Name	DI Read State 8 Input Line
Object Type	ARRAY
Data Type	BOOLEAN

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	1
Default Value	1

Sub-Index	1h
Description	Digital Input State Bitmap D1-D2
Access	RO
PDO Mapping	Yes
Value Range	0 (OFF) or 1 (ON)
Default Value	0

2.3.2. Objetc 6002: DI Polarity 8 input Lines

This object shall define the polarity of a group of 8 input lines. This object determines how the state read on the input pin corresponds to the logic state, in conjunction with manufacturer object 2020h, as defined in Table 2.

Object Description

Index	6002h
Name	DI Polarity 1 Input Line
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	1
Default Value	1

Sub-Index	1h
-----------	----

Description	Digital Input Polarity Bitmap D1-D2
Access	RW
PDO Mapping	No
Value Range	See Table 2
Default Value	0 (Normal On/Off)

2.3.3. Object 7100h: AI Input Field Value

This object represents the measured value of an analog input that has been scaled as per manufacturer object 2102h AI Decimal Digits PV. The base unit for each type of input is defined in Table 4, as well as the read-only resolution (decimal digits) associated with the FV.

Object Description

Index	7100h
Name	AI Input Field Value
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Alx Input Field Value
Access	RO
PDO Mapping	Yes
Value Range	Data Type Specific, see Table 5
Default Value	No

2.3.4. Object 6110h: AI Sensor Type

This object defines the type of sensor (input) which is connected to the analog input pin.

Object Description

Index	6110h
Name	AI Sensor Type
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO

PDO Mapping	No
Value Range	1
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AIx Sensor Type
Access	RW
PDO Mapping	No
Value Range	See Table 4
Default Value	40 (Voltage)

2.3.5. Object 6112h: AI Operating Mode

This object enables special operating modes for the input.

Object Description

Index	6112h
Name	AI Operating Mode
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AIx Operating Mode
Access	RW
PDO Mapping	No
Value Range	See Table 3
Default Value	1 (normal mode)

2.3.6. Object 7120h: AI Input Scaling 1 FV

This object describes the field value of the first calibration point for the analog input channel, as shown in Figure 8. It also defines the “minimum” value of the analog input range when using this input as a control source for another function block, as described in Table 17 in Section 1.4. It is scaled in the physical unit of the FV, i.e. object 2102h applies to this object.

Object Description

Index	7120h
Name	AI Input Scaling 1 FV
Object Type	ARRAY

Data Type	INTEGER16
-----------	-----------

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AIx Input Scaling 1 FV
Access	RW
PDO Mapping	No
Value Range	See Table 10
Default Value	500 [mV]

2.3.7. Object 7121h: AI Input Scaling 1 PV

This object defines the process value of the first calibration point for the analog input channel, as shown in Figure 8. It is scaled in the physical unit of the PV, i.e. object 6132h applies to this object.

Object Description

Index	7121h
Name	AI Input Scaling 1 PV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AIx Input Scaling 1 PV
Access	RW
PDO Mapping	No
Value Range	Integer16
Default Value	500 [same as 7120h]

2.3.8. Object 7122h: AI Input Scaling 2 FV

This object describes the field value of the second calibration point for the analog input channel, as shown in Figure 8. It also defines the “maximum” value of the analog input range when using this input as a control

source for another function block, as described in Table 17 in Section 1.4. It is scaled in the physical unit of the FV, i.e. object 2102h applies to this object.

Object Description

Index	7122h
Name	AI Input Scaling 2 FV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Alx Input Scaling 2 FV
Access	RW
PDO Mapping	No
Value Range	See Table 10
Default Value	4500 [mV]

2.3.9. Object 7123h: AI Input Scaling 2 PV

This object defines the process value of the second calibration point for the analog input channel, as shown in Figure 8. It is scaled in the physical unit of the PV, i.e. object 6132h applies to this object.

Object Description

Index	7123h
Name	AI Input Scaling 2 PV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Alx Input Scaling 2 PV
Access	RW
PDO Mapping	No
Value Range	Integer16
Default Value	4500 [same as 7122h]

2.3.10.Object 7130h: AI Input Process Value

This object represents the result of the input scaling applied per Figure 8, and gives the measured quantity scaled in the physical unit of the process value (i.e. °C, PSI, RPM, etc) with the resolution defined in object 6132h AI Decimal Digits PV.

Object Description

Index	7130h
Name	AI Input Process Value
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Alx Input Process Value
Access	RO
PDO Mapping	Yes
Value Range	Integer16
Default Value	No

2.3.11.Object 6132h: AI Decimal Digits PV

This object describes the number of digits following the decimal point (i.e. resolution) of the input data, which is interpreted with data type Integer16 in the process value object.

Example: A process value of 1.230 (Float) will be coded as 1230 in Integer16 format if the number of decimal digits is set to 3.

Object Description

Index	6123h
Name	AI Decimal Digits PV
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Alx Decimal Digits PV
Access	RW
PDO Mapping	No

Value Range	0 to 3
Default Value	3 [mV]

2.3.12.Object 7148h: AI Span Start

This value specifies the lower limit where field values are expected. Field values, which are lower than this limit, are marked as negative overload. It is scaled in the physical unit of the FV, i.e. object 2102h applies to this object.

Object Description

Index	7148h
Name	AI Span Start
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AIx Span Start (Error Min)
Access	RW
PDO Mapping	No
Value Range	See Table 10
Default Value	200 [mV]

2.3.13.Object 7149h: AI Span End

This value specifies the upper limit where field values are expected. Field values, which are higher than this limit, are marked as positive overload. It is scaled in the physical unit of the FV, i.e. object 2102h applies to this object.

Object Description

Index	7149h
Name	AI Span End
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Alx Span End (Error Max)
Access	RW
PDO Mapping	No
Value Range	See Table 10
Default Value	5000 [mV]

2.3.14.Object 61A0h: AI Filter Type

This object defines the type of data filter that will be applied to the raw input data, as read from the ADC or Timer, before it is passed to the field value object. The types of data filters are defined in Table 7, and how they are used is outlined in Section 1.2.

Object Description

Index	61A0h
Name	AI Filter Type
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Alx Filter Type
Access	RW
PDO Mapping	No
Value Range	See Table 7
Default Value	0 (no filter)

2.3.15.Object 61A1h: AI Filter Constant

This object defines the number of steps used in the various filters, as defined in Section 1.2.

Object Description

Index	61A0h
Name	AI Filter Constant
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported

Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AIx Filter Constant
Access	RW
PDO Mapping	No
Value Range	1 to 100
Default Value	1

2.3.16. Object 6200h: DO Write state 8 Output lines

This object shall set a group of 8 output lines as a byte of information.

Object Description

Index	6200h
Name	DO Write State 8 Output Line
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	1
Default Value	1

Sub-Index	1h
Description	DO1-DO2 Write State
Access	RW
PDO Mapping	Yes
Value Range	0 (OFF) or 1 (ON)
Default Value	0 (OFF)

2.3.17. Object 6202h: DO Polarity 8 Input Lines

This object defines the polarity of a group of 8 output lines.

Object Description

Index	6202h
Name	DO Polarity 8 Output Lines
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO

PDO Mapping	No
Value Range	1
Default Value	1

Sub-Index	1h
Description	DO1-DO2 Polarity
Access	RW
PDO Mapping	No
Value Range	See Table 11
Default Value	0 (normal on/off)

2.3.18. Object 6250h: DO Fault Mode 1 Output Line

This object defines the fault mode of a group of 8 output lines (1 bit per line). The object determines the how each line shall respond when a fault condition is detected on any control input, as described in Table 13.

Object Description

Index	6250h
Name	DO Fault Mode 1 Output Line
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	1
Default Value	1

Sub-Index	1h
Description	DO1-DO2 Fault Mode
Access	RW
PDO Mapping	No
Value Range	See Table 13
Default Value	1 (apply pre-defined state)

2.3.19. Object 6260h: DO Fault State 1 Output Line

This object defines the pre-defined state on detecting a fault condition. It is defined for a group of 8 output lines. The corresponding bit must be set in the default output line mode (Object 6206).

Object Description

Index	6260h
Name	DO Fault State 1 Output Line
Object Type	ARRAY
Data Type	BOOLEAN

Entry Description

Sub-Index	0h
Description	Largest sub-index supported

Access	RO
PDO Mapping	No
Value Range	1
Default Value	1

Sub-Index	1h
Description	DO1-DO2 Fault State
Access	RW
PDO Mapping	No
Value Range	0 (OFF) or 1 (ON)
Default Value	1 (ON)

2.3.20. Object 7300h: AO Output Process Value

This object represents the process value of the output. It can be used as an input to the analog output function block when the input has been selected as controlled by a CANopen® Message (per Table 22 in Section 1.5).

Object Description

Index	7300h
Name	AO Output Process Value
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Output Process Value
Access	RW
PDO Mapping	Yes
Value Range	Integer16
Default Value	No

2.3.21. Object 6302h: AO Decimal Digits PV

This object describes the number of digits following the decimal point (i.e. resolution) of the output control data, which is interpreted with data type Integer16 in the process value object.

Object Description

Index	6302h
Name	AO Decimal Digits PV
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
-----------	----

Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Decimal Digits PV
Access	RW
PDO Mapping	No
Value Range	0 to 3
Default Value	3 [V to mV] (see Table 16)

2.3.22. Object 6310h: AO Output Type

This object specifies the type of analog output, as defined in Table 14.

Object Description

Index	6310h
Name	AO Output Type
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Output Type
Access	RW
PDO Mapping	No
Value Range	See Table 14
Default Value	10 (voltage)

2.3.23. Object 7320h: AO Output Scaling 1 PV

This object defines the minimum value of the input, and should be specified to equal the corresponding scaling object of the control source, as outlined in Table 17. It will be scaled in the physical unit of the control source. The resolution will ALWAYS be dependent on object 6302h AO Decimal Digits PV, even when the output is not being controlled directly by the AO Output PV object 7300h. This object must always be smaller than object 7322h AO Output Scaling 2 PV.

Object Description

Index	7320h
Name	AO Output Scaling 1 PV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Output Scaling 1 PV
Access	RW
PDO Mapping	No
Value Range	See Table 17
Default Value	0 [mV]

2.3.24. Object 7321h: AO Output Scaling 1 FV

This object defines the output field value when the input data is at or below the AO Output Scaling 1 PV value as shown in Figure 11. It will be scaled in the physical unit of the output, dependent on type, with the resolution defined in object 6332h AO Decimal Digits FV. The value can be set anywhere within the allowable output range as outlined in Table 15. This value can be set higher than object 7323h AO Output Scaling 2 FV for an inverse response (i.e. decreasing) to an increasing input.

Object Description

Index	7321h
Name	AO Output Scaling 1 FV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Output Scaling 1 FV
Access	RW
PDO Mapping	No
Value Range	Dependent on type and range (see Table 17)
Default Value	0 [mV] (see Table 16)

2.3.25. Object 7322h: AO Output Scaling 2 PV

This object defines the maximum value of the input, and should be specified to equal the corresponding scaling object of the control source, as outlined in Table 15. It will be scaled in the physical unit of the control source. The resolution will ALWAYS be dependent on object 6302h AO Decimal Digits PV, even when the

output is not being controlled directly by the AO Output PV object 7300h. This object must always be larger than object 7322h AO Output Scaling 2 PV.

Object Description

Index	7322h
Name	AO Output Scaling 2 PV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Output Scaling 2 PV
Access	RW
PDO Mapping	No
Value Range	See Table 17
Default Value	5000 [mV]

2.3.26. Object 7323h: AO Output Scaling 2 FV

This object defines the output field value when the input data is at or above the AO Output Scaling 2 PV value as shown in Figure 11. It will be scaled in the physical unit of the output, dependent on type, with the resolution defined in object 6332h AO Decimal Digits FV. The value can be set anywhere within the allowable output range as outlined in Table 15.. This value can be set lower than object 7321h AO Output Scaling 1 FV for an inverse response (i.e. decreasing) to an increasing input.

Object Description

Index	7323h
Name	AO Output Scaling 2 FV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Output Scaling 2 FV
Access	RW
PDO Mapping	No
Value Range	Dependent on type (see Table 17)
Default Value	5000 [mV] (see Table 16)

2.3.27. Object 7330h: AO Output Field Value

This object represents the target output drive field value as a result of the output logic described in Section 1.4, and the scaling applied as shown in Figure 11. It is defined in the physical unit of the output dependent on type, as outlined in Table 16. The resolution of the object is defined in object 6332h AO Decimal Digits FV.

Object Description

Index	7330h
Name	AO Output Field Value
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Output Field Value
Access	RO
PDO Mapping	Yes
Value Range	Integer16
Default Value	No

2.3.28. Object 6332h: AO Decimal Digits FV

This object describes the number of digits following the decimal point (i.e. resolution) of the output data, which is interpreted with data type Integer16 in the field value object.

Object Description

Index	6332h
Name	AO Decimal Digits FV
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Decimal Digits FV
Access	RW

PDO Mapping	No
Value Range	0 to 3
Default Value	3 [mV] See Table 16

2.3.29. Object 6340h: AO Fault Mode

This object defines how an output shall response when a fault condition is detected on any control input, as described in Table 20.

Object Description

Index	6340h
Name	AO Fault Mode
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Fault Mode
Access	RW
PDO Mapping	No
Value Range	See Table 20
Default Value	1 (apply pre-defined FV)

2.3.30. Object 7341h: AO Fault Field Value

This object contains the pre-defined field value of an analog output when a fault condition is present, and the corresponding sub-index in object 7341h is enabled. It will be scaled in the physical unit of the output, dependent on type, with the resolution defined in object 6332h AO Decimal Digits FV.

Object Description

Index	7341h
Name	AO Fault Field Value
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Fault Field Value
Access	RW
PDO Mapping	No
Value Range	Dependent on type and range (see Table 16)
Default Value	500 [mV]

2.3.31. Object 7450h: PID Proportional Band

This object describes the proportional band gain (G in Figure 14) of the PID algorithm. The value is always interpreted as having a resolution of one digit after the decimal place.

Object Description

Index	7450h
Name	PID Proportional Band
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Proportional Gain
Access	RW
PDO Mapping	No
Value Range	0 to 100 (0 to 10.0)
Default Value	5 [0.5]

2.3.32. Object 7452h: PID Integral Action Time

This object describes the integral time (Ti in Figure 14) of the PID algorithm. The physical unit is always seconds, as defined in object 6458h, with the decimal digits (resolution) given in object 6459h. To prevent instability, it is recommended to never set this less than three times higher than object 7454h (Td in Figure 14).

Object Description

Index	7452h
Name	PID Integral Action Time
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No

Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Integral Action Time
Access	RW
PDO Mapping	No
Value Range	0.001 [sec] to 1000.00 [sec]
Default Value	5 [ms or 0.005sec]

2.3.33. Object 7454h: PID Derivative Action Time

This object describes the derivative time (Td in Figure 14) of the PID algorithm. The physical unit is always seconds, as defined in object 6458h, with the decimal digits (resolution) given in object 6459h. To prevent instability, it is recommended to never set this more than three times smaller than object 7452h (Ti in Figure 14).

Object Description

Index	7454h
Name	PID Derivative Action Time
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Derivative Action Time
Access	RW
PDO Mapping	No
Value Range	0.001 [sec] to 1000.00 [sec]
Default Value	1 [ms or 0.001sec]

2.3.34. Object 7456h: PID Cycle Time

This object defines how frequently the PID loop is called. The physical unit is always seconds, as defined in object 6458h, with the decimal digits (resolution) given in object 6459h.

Object Description

Index	7456h
Name	PID Cycle Time
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported

Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Cycle Time
Access	RW
PDO Mapping	No
Value Range	0.001 [sec] to 1000.00 [sec]
Default Value	10 [ms or 0.010sec]

2.3.35. Object 6458h: PID Physical Unit Timing

This read-only object defines the physical unit of objects 7452h, 7454h and 7456h. It represents “seconds” as the unit used in all cases.

Object Description

Index	6458h
Name	PID Physical Unit Timing
Object Type	ARRAY
Data Type	UNSIGNED32

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Physical Unit Timing
Access	RO
PDO Mapping	No
Value Range	0003 0000h
Default Value	0003 0000h (seconds)

2.3.36. Object 6459h: PID Decimal Digits Timing

This object describes the number of digits following the decimal point (i.e. resolution) of the PID timing data, which is interpreted with data type Integer16 in objects 7452h, 7454h and 7456h.

Object Description

Index	6459h
Name	PID Decimal Digits Timing
Object Type	ARRAY
Data Type	UNSIGNED8

2.4.1. Object 2020h: DI Pull UP/Down Mode 1 Input Line

This object determines how the state read on the input pin corresponds to the logic state, in conjunction with application object 6002h, as defined in Section 1.1. The options for this object are listed in Table 1, and the controller will adjust the input hardware according to what is specified.

Object Description

Index	2020h
Name	DI Pullup/Down Mode 1 Input Line
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Digital Input x Pullup/Down
Access	RW
PDO Mapping	No
Value Range	See Table 1
Default Value	0 (pullup/down disabled)

2.4.2. Object 2100h: AI Input Range

This object, in conjunction with 6110h AI Sensor Type, defines the analog input defaults (Table 9) and allowable ranges (Table 10) for objects 2111h, 7120h, 7122h, 7148h and 7149h. The number and types of ranges will vary according to what type of sensor is connected to the input, as described in Table 8.

Object Description

Index	2100h
Name	AI Input Range
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Input x Range
Access	RW
PDO Mapping	No
Value Range	See Table 8
Default Value	1 [0-5V]

2.4.3. Object 2101h: AI Number of Pulses Per Revolution

This object is only used when a “Frequency” input type has been selected by object 6110h. The controller will automatically convert frequency measurement from Hz to RPM when a non-zero value is specified. In this case, objects 2111h, 7120h, 7122h, 7148h and 7149h will be interpreted as RPM data. Object 2100h AI Input Range must still be specified in Hertz, and should be selected according to the expected frequencies that the RPM sensor will operate in.

Object Description

Index	2101h
Name	AI Number of Pulses Per Revolution
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Alx Number of Pulses Per Revolution
Access	RW
PDO Mapping	No
Value Range	0 to 1000
Default Value	0

2.4.4. Object 2102h: AI Decimal Digits FV

This object describes the number of digits following the decimal point (i.e. resolution) of the input data, which is interpreted with data type Integer16 in the field value object.

Example: A field value of 1.230 (Float) will be coded as 1230 in Integer16 format if the number of decimal digits is set to 0.

In addition to the FV object 7100h, objects 2111h, 7120h, 7122h, 7148h and 7149h will also be specified with this resolution. This object is normally read-only, and will be automatically adjusted by the controller as per Table 8 depending on the analog input type and range that has been selected. When object 5550h is set to FALSE (disables automatic updates), this object becomes writeable.

Object Description

Index	2102h
Name	AI Decimal Digits FV
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO

PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AIx Decimal Digits FV
Access	RW (only when object 5550h is false)
PDO Mapping	No
Value Range	See Table 8Table 8
Default Value	3 [1 mV]

2.4.5. Object 2103h: AI Debounce Filter

This object will select input capture debounce filter applied frequency, PWM or mixed type of input as shown in Figure 7. The options for this object are listed in Table 6.

Object Description

Index	2103h
Name	AI Debounce Filter
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AIx Debounce Filter
Access	RW
PDO Mapping	No
Value Range	See Table 6
Default Value	2 [Filter 1.78 us]

2.4.6. Object 2110h: AI Error Detect Enable

This object enables error detection and reaction associated with the analog input function block. When disabled, the input will not generate an EMCY code in object 1003h Pre-Defined Error Field, nor will it disable any output controlled by the input should the input go out of range as defined by the objects 7148h AI Span Start and 7149h AI Span End.

Object Description

Index	2110h
Name	AI Error Detect Enable

Object Type	ARRAY
Data Type	BOOLEAN

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AIx Error Detect Enable
Access	RW
PDO Mapping	No
Value Range	0 (FALSE) or 1 (TRUE)
Default Value	0 [FALSE]

2.4.7. Object 2111h: AI Error Clear Hysteresis

This object is used to prevent rapid activation/clearing of an input fault flag, and sending of object 1003h to the CANopen® network. Once the input has gone above/below the thresholds that define the valid operating range, it must come back into range minus/plus this value to clear the fault. It is scaled in the physical unit of the FV, i.e. object 2102h applies to this object.

Object Description

Index	2111h
Name	AI Error Clear Hysteresis
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AIx Error Clear Hysteresis
Access	RW
PDO Mapping	No
Value Range	See Table 10
Default Value	100 [mV]

2.4.8. Object 2112h: AI Error Reaction Delay

This object is used to filter out spurious signals and to prevent saturating the CANopen® network with broadcasts of object 1003h as the fault is set/cleared. Before the fault is recognized (i.e. the EMCY code is added to the pre-defined error field list), it must remain active throughout the period of time defined in this object. The physical unit for this object is milliseconds.

Object Description

Index	2112h
Name	AI Error Reaction Delay
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h

Sub-Index	1h to 2h (x = 1 to 2)
Description	Alx Error Reaction Delay
Access	RW
PDO Mapping	No
Value Range	0 to 60,000
Default Value	1000 [ms]

2.4.9. Object 2224h: DO Delay Time 1 Output Line

This object is used only when an ON/OFF digital output has been specified for a normal ON/OFF response by object 6202h DO Polarity (only applies to Normal ON/OFF). While the DO is commanded, the output will remain in the previous state until the time specified in this object has elapsed prior to changing to the commanded state. The physical unit is milliseconds. The polarity for which the delay will take effect is specified by object 2225h.

Object Description

Index	2225h
Name	DO Delay Time Output Line
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Outx Delay Time
Access	RW
PDO Mapping	No
Value Range	0 to 60,000
Default Value	0 [ms]

2.4.10. Object 2225h: DO Delay Polarity 1 Output Line

This object is used only when an ON/OFF digital output has been specified for a normal ON/OFF response by object 6240h DO Polarity (only applies to Normal ON/OFF). While the DO is commanded to the state specified by this object, the output will remain in the previous state until the time specified by object 2224h has elapsed prior to driving the output to the commanded state.

Object Description

Index	2225h
Name	DO Delay Time Output Line
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	Outx Delay Time
Access	RW
PDO Mapping	No
Value Range	0 (OFF) to 1 (ON)
Default Value	1 [ON]

2.4.11. Object 2300h: AO Override Field Value

This object contains the pre-defined field value of an analog output when an override condition is active. It will be scaled in the physical unit of the output, dependent on type, with the resolution defined in object 6332h AO Decimal Digits FV.

Object Description

Index	2300h
Name	AO Override FV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported

Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Override FV
Access	RW
PDO Mapping	No
Value Range	Dependent on type and range (see Table 15)
Default Value	500 [mV]

2.4.12. Object 2302h: AO Output Range

This object specifies the range of analog output. Together with Object 6310h AO Output type Output Range specifies allowable ranges for output scaling objects, as defined in Table 17.

Object Description

Index	6310h
Name	AO Output Range
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Output Range
Access	RW
PDO Mapping	No
Value Range	See Table 17
Default Value	0 (voltage 0 to 5V)

2.4.13. Object 2310h: AO Error Detect Enable

This object enables error detection and reaction associated with the analog output function block. When disabled, the input will not generate an EMCY code in object 1003h Pre-Defined Error Field should the control detect an open/short circuit at the load.

Object Description

Index	2310h
Name	AO Error Detect Enable
Object Type	ARRAY
Data Type	BOOLEAN

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Error Detect Enable
Access	RW
PDO Mapping	No
Value Range	0 (FALSE) or 1 (TRUE)
Default Value	1 [TRUE]

2.4.14. Object 2311h: AO Error Clear Hysteresis

This object is used to define the absolute difference that can be tolerated between the target output (as commanded by the control input) and the measured feedback. Any difference outside of the value will flag an open or short circuit fault. It is scaled in the physical unit of the output FV, i.e. object 6332h applies to this object.

Object Description

Index	2311h
Name	AO Error Clear Hysteresis
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Error Clear Hysteresis
Access	RW
PDO Mapping	No
Value Range	0 to 10% of 7321h or 7323h, whichever is larger
Default Value	100 [mV]

2.4.15. Object 2312h: AO Error Reaction Delay

This object is used to filter out spurious signals and to prevent saturating the CANopen® network with broadcasts of object 1003h as the fault is set/cleared. Before the fault is recognized (i.e. the EMCY code is added to the pre-defined error field list), it must remain active throughout the period of time defined in this object. The physical unit for this object is milliseconds.

Object Description

Index	2312h
Name	AO Error Reaction Delay
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Error Reaction Delay
Access	RW
PDO Mapping	No
Value Range	0 to 60,000
Default Value	1000 [ms]

2.4.16. Object 2330h: AO Ramp Up

This object defines the time it will take to ramp from the minimum output PV to the maximum as defined by objects 7321h and 7323h. It can be used to soften the response to a step change at the input. The physical unit for this object is milliseconds.

Object Description

Index	2330h
Name	AO Ramp Up
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Ramp Up
Access	RW
PDO Mapping	No
Value Range	0 to 60,000
Default Value	1000 [ms]

2.4.17. Object 2331h: AO Ramp Down

This object defines the time it will take to ramp from the maximum output PV to the minimum as defined by objects 7321h and 7323h. It can be used to soften the response to a step change at the input. The physical unit for this object is milliseconds.

Object Description

Index	2331h
Name	AO Ramp Down
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Ramp Down
Access	RW
PDO Mapping	No
Value Range	0 to 60,000
Default Value	1000 [ms]

2.4.18. Object 2340h: AO Control Input Source

This object defines the type of input that will be used to control the analog (or digital) output as shown in the logic flowchart in Figure 12. The available control sources on the 2IN-2OUT-SIG-CO controller are listed in Table 22. Not all sources would make sense to control the AO, and it is the user's responsibility to select a source that makes sense for the application.

Object Description

Index	2340h
Name	AO Control Input Source
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Control Input Source
Access	RW

PDO Mapping	No
Value Range	See Table 22
Default Value	0 (control not used)

2.4.19. Object 2341h: AO Control Input Number

This object defines the number of the source that will be used to control the analog (or digital) output as shown in the logic flowchart in Figure 12. The available control numbers are dependent on the source selected, as shown in Table 23. Once selected, the control represents the process value (X-Axis input) in Figure 11. Objects 6302h, 7320h, 7322h should therefore be updated to match the scaling limits defined by the control source/number, as listed in Table 17.

Object Description

Index	2341h
Name	AO Control Input Number
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Control Input Number
Access	RW
PDO Mapping	No
Value Range	See Table 23
Default Value	0 (control not used)

2.4.20. Object 2350h: AO Enable Input Source

This object defines the type of input that will be used to enable/disable the analog (or digital) output as shown in the logic flowchart in Figure 12. The available control sources on the 2IN-2OUT-SIG-CO controller are listed in Table 22. Not all sources would make sense to enable the AO, and it is the user's responsibility to select a source that makes sense for the application.

Object Description

Index	2350h
Name	AO Enable Input Source
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported

Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Enable Input Source
Access	RW
PDO Mapping	No
Value Range	See Table 22
Default Value	0 (control not used)

2.4.21. Object 2351h: AO Enable Input Number

This object defines the number of the source that will be used to enable/disable the analog (or digital) output as shown in the logic flowchart in Figure 12. The available control numbers are dependent on the source selected, as shown in Table 23.

Object Description

Index	2351h
Name	AO Enable Input Number
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Enable Input Number
Access	RW
PDO Mapping	No
Value Range	See Table 23
Default Value	0 (null control source)

2.4.22. Object 2352h: AO Enable Response

This object determines if the input will act as an enable or safety interlock (i.e. input must be ON to engage the output) or a disable signal (i.e. the output will shutoff when the input is ON.) The options for this object are listed in Table 18.

Object Description

Index	2352h
Name	AO Enable Response

Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h ($x = 1$ to 2)
Description	AO x Enable Response
Access	RW
PDO Mapping	No
Value Range	See Table 18
Default Value	0 (Enable When On, Else Shutoff)

2.4.23. Object 2360h: AO Override Input Source

This object defines the type of input that will be used to active the override value for the analog outputs as shown in the logic flowchart in Figure 12. The available control sources on the 2IN-2OUT-SIG-CO controller are listed in Table 22. Not all sources would make sense to enable the AO, and it is the user's responsibility to select a source that makes sense for the application.

Object Description

Index	2360h
Name	AO Override Input Source
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h ($x = 1$ to 2)
Description	AO x Override Input Source
Access	RW
PDO Mapping	No
Value Range	See Table 22
Default Value	0 (control not used)

2.4.24. Object 2361h: AO Override Input Number

This object defines the number of the source that will be used to override the analog outputs as shown in the logic flowchart in Figure 12. The available control numbers are dependent on the source selected, as shown in Table 23.

Object Description

Index	2361h
Name	AO Override Input Number
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Override Input Number
Access	RW
PDO Mapping	No
Value Range	See Table 23
Default Value	0 (null control source)

2.4.25. Object 2362h: AO Override Response

This object determines how the override command will respond to the input state. The options for this object are listed in Table 19.

Object Description

Index	2362h
Name	AO Override Response
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Override Response
Access	RW
PDO Mapping	No
Value Range	See Table 19
Default Value	0 (Override When On)

2.4.26. Object 2370h: AO Feedback Field Value

This read-only object reflects the actual measured feedback of an output. It can be mapped to a PDO for diagnostic purposes. It will be scaled in the physical unit of the output, dependent on type, with the resolution defined in object 6332h AO Decimal Digits FV.

Object Description

Index	2370h
Name	AO Feedback Field Value
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Feedback Field Value
Access	RO
PDO Mapping	Yes
Value Range	Dependent on type and range (seeTable 15)
Default Value	No

2.4.27. Object 2380h: AO Output Frequency

This object is used to set the frequency of the output in PWM mode or duty cycle of the output in frequency mode.

Object Description

Index	2380h
Name	AO Output Frequency
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
-----------	-----------------------

Description	AOx Frequency
Access	RW
PDO Mapping	No
Value Range	1-50,000 Hertz or 0-100%
Default Value	250 [Hz]

2.4.28. Object 2381h: AO Output Frequency PWM Amplitude

This object is used to select the amplitude of output in PWM, frequency, digital and mixed output modes.

Object Description

Index	2381h
Name	AO Output Frequency PWM Amplitude
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Output Frequency PWM Amplitude
Access	RW
PDO Mapping	No
Value Range	See Table 21
Default Value	0 (5V amplitude)

2.4.29. Object 2390h: AO Frequency Input Source

This object defines the type of input that will be used to control frequency of output in mixed output mode. The available control sources on the 2IN-2OUT-SIG-CO controller are listed in Table 22. Not all sources would make sense to control the AO, and it is the user's responsibility to select a source that makes sense for the application.

Object Description

Index	2390h
Name	AO Frequency Input Source
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No

Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Frequency Input Source
Access	RW
PDO Mapping	No
Value Range	See Table 22
Default Value	0 (control not used)

2.4.30. Object 2391h: AO Frequency Input Number

This object defines the number of the source that will be used to control frequency of output in mixed output mode. The available control numbers are dependent on the source selected, as shown in Table 23. Once selected, the control represents the process value (X-Axis input) in Figure 11. Objects 2392h, 2394h should therefore be updated to match the scaling limits defined by the control source/number, as listed in Table 17.

Object Description

Index	2361h
Name	AO Frequency Input Number
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Frequency Input Number
Access	RW
PDO Mapping	No
Value Range	See Table 23
Default Value	0 (null control source)

2.4.31. Object 2392h: AO Frequency Scaling 1 FV

This object defines the output frequency minimum value in mixed output mode.

Object Description

Index	7321h
Name	AO Frequency Scaling 1 FV
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Frequency Scaling 1 FV
Access	RW
PDO Mapping	No
Value Range	0 to 50 000 Hz
Default Value	50 [Hz]

2.4.32. Object 2394h: AO Frequency Scaling 2 FV

This object defines the output frequency maximum value in mixed output mode.

Object Description

Index	7323h
Name	AO Frequency Scaling 2 FV
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	AOx Frequency Scaling 2 FV
Access	RW
PDO Mapping	No
Value Range	0 to 50 000 Hz
Default Value	25 000 [Hz]

2.4.33. Object 2450h: PID Tolerance

This object defines the allowable absolute difference between the target and the feedback, below which the error will be interpreted as zero (i.e. PID output stops changing). The physical unit for this object is percentage, and the value is always interpreted as having a resolution of one digit after the decimal place.

Object Description

Index	2450h
Name	PID Tolerance
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	argest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Tolerance
Access	RW
PDO Mapping	No
Value Range	0 to 100 (0% to 10%)
Default Value	10 [1%]

2.4.34. Object 2451h: PID Integral Gain

This object describes the integral gain (K_i in Figure 14) of the PID algorithm. The value is always interpreted as having a resolution of one digit after the decimal place.

Object Description

Index	2451h
Name	PID Integral Gain
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Integral Gain
Access	RW
PDO Mapping	No
Value Range	0 to 100
Default Value	10 [1.0]

2.4.35. Object 2452h: PID Derivative Gain

This object describes the derivative gain (K_d in Figure 14) of the PID algorithm. The value is always interpreted as having a resolution of one digit after the decimal place.

Object Description

Index	2452h
-------	-------

Name	PID Derivative Gain
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Derivative Gain
Access	RW
PDO Mapping	No
Value Range	0 to 100
Default Value	10 [1.0]

2.4.36. Object 2453h: PID Target Source

This object defines the type of input that will be used to determine the target process value for the PID control loop. The available control sources on the 2IN-2OUT-SIG-CO controller are listed in Table 22. Not all sources would make sense to use as a PID target source, and it is the user's responsibility to select a source that makes sense for the application. A selection of "Control Source Not Used" disables the associated PID control function block.

Object Description

Index	2453h
Name	PID Target Source
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Target Source
Access	RW
PDO Mapping	No
Value Range	See Table 22
Default Value	0 (control not used, PID disabled)

2.4.37. Object 2454h: PID Target Number

This object defines the number of the source that will be used as the target PV for the PID control loop. The available control numbers are dependent on the source selected, as shown in Table 23. Once selected, the control will convert the commanded target into a percentage value using the scaling limits of the control source/number as defined in Table 17.

Object Description

Index	2454h
Name	PID Target Number
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PID _x Target Number
Access	RW
PDO Mapping	No
Value Range	See Table 23
Default Value	x

2.4.38. Object 2455h: PID Feedback Source

This object defines the type of input that will be used to determine the feedback process value for the PID control loop. The available control sources on the 2IN-2OUT-SIG-CO controller are listed in Table 22. Not all sources would make sense to use as a PID feedback source, and it is the user's responsibility to select a source that makes sense for the application. A selection of "Control Source Not Used" disables the associated PID control function block.

Object Description

Index	2455h
Name	PID Feedback Source
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Feedback Source
Access	RW
PDO Mapping	No
Value Range	See Table 22
Default Value	0 (control not used, PID disabled)

2.4.39. Object 2456h: PID Feedback Number

This object defines the number of the source that will be used as the feedback PV for the PID control loop. The available control numbers are dependent on the source selected, as shown in Table 23. Once selected, the control will convert the measured/received feedback into a percentage value using the scaling limits of the control source/number as defined in Table 17.

Object Description

Index	2456h
Name	PID Feedback Number
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Feedback Number
Access	RW
PDO Mapping	No
Value Range	See Table 23
Default Value	x

2.4.40. Object 2457h: PID Control Response

This object defines the output profile for the PID control function block in a push-pull dual output system. The options for this object are listed in Table 24.

Object Description

Index	2457h
Name	PID Control Response
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO

PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Control Response
Access	RW
PDO Mapping	No
Value Range	See Table 24
Default Value	0 (single output)

2.4.41. Object 2460h: PID Output Field Value

This read-only output contains the PID control function block FV (as a percentage) that can be used as the input source for another function block (i.e. analog output.) It will be a value between 0 to 100% as per the algorithm defined in Figure 14. The physical unit for this object is percentage, and the value is always interpreted as having a resolution of one digit after the decimal place.

Object Description

Index	2460h
Name	PID Output FV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	2
Default Value	2

Sub-Index	1h to 2h (x = 1 to 2)
Description	PIDx Output FV
Access	RO
PDO Mapping	Yes
Value Range	0 to 1000 (0 to 100%)
Default Value	No

2.4.42. Object 2500h: EC Extra Received Process Value

This object provides an extra control source in order to allow other function blocks to be controlled by data received from a CANopen® RPDO. It functions similarly to any other writeable, mappable PV object.

Object Description

Index	2500h
Name	EC Extra Received Process Value
Object Type	ARRAY

Data Type	INTEGER16
-----------	-----------

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	14
Default Value	14

Sub-Index	1h to 14h (x = 1 to 14)
Description	ECx Extra Received Process Value
Access	RW
PDO Mapping	Yes
Value Range	Integer16
Default Value	No

2.4.43.Object 2502h: EC Decimal Digits PV

This object describes the number of digits following the decimal point (i.e. resolution) of the extra control data, which is interpreted with data type Integer16 in the process value object.

Object Description

Index	2502h
Name	EC Decimal Digits PV
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	15
Default Value	15

Sub-Index	1h to 15h (x = 1 to 15)
Description	ECx Decimal Digits PV
Access	RW
PDO Mapping	No
Value Range	0 to 3
Default Value	2 (0.01 resolution)

2.4.44.Object 2520h: EC Scaling 1 PV

This object defines the minimum value of the extra control source. It used as the Scaling 1 value by other functions blocks when the EC has been selected as the source for the X-Axis data, i.e. as seen in Figure 11.

There is no physical unit associate with the data, but it uses the same resolution as the received PV as defined in object 2502h, EC Decimal Digits PV. This object must always be smaller than object 2522h EC Scaling 2 PV.

Object Description

Index	2520h
Name	EC Scaling 1 PV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	15
Default Value	15

Sub-Index	1h to 15h (x = 1 to 15)
Description	ECx Scaling 1 PV
Access	RW
PDO Mapping	No
Value Range	-32768 to 2522h sub-index X
Default Value	0

2.4.45.Object 2522h: EC Scaling 2 PV

This object defines the maximum value of the extra control source. It used as the Scaling 2 value by other functions blocks when the EC has been selected as the source for the X-Axis data, i.e. as seen in Table 17. There is no physical unit associate with the data, but it uses the same resolution as the received PV as defined in object 2502h, EC Decimal Digits PV. This object must always be larger than object 2520h EC Scaling 1 PV.

Object Description

Index	2522h
Name	EC Scaling 2 PV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	15
Default Value	15

Sub-Index	1h to 15h (x = 1 to 15)
Description	ECx Scaling 2 PV
Access	RW

PDO Mapping	No
Value Range	2520h sub-index X to 32767
Default Value	1000 (10.00)

2.4.46.Object 3yz0h: LTyz Input X-Axis Source

This object defines the type of input that will be used to determine the X-Axis input process value for the lookup table function. The available control sources on the 2IN-2OUT-SIG-CO controller are listed in Table 22. Not all sources would make sense to use as an X-Axis input, and it is the user's responsibility to select a source that makes sense for the application. A selection of "Control Source Not Used" disables the associated lookup table function block.

Object Description

Index	3yz0h (where yz = 01 to 08)
Name	LTyz Input X-Axis Source
Object Type	VARIABLE
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Access	RW
PDO Mapping	No
Value Range	See Table 22
Default Value	0 (control not used)

2.4.47.Object 3yz1h: LTyz Input X-Axis Number

This object defines the number of the source that will be used as the X-Axis input PV for the lookup table function. The available control numbers are dependent on the source selected, as shown in Table 22. Once selected, the limits for the points on the X-Axis will be constrained by the scaling objects of the control source/number as defined in Table 23.

Object Description

Index	3yz1h (where yz = 01 to 08)
Name	LTyz Input X-Axis Number
Object Type	VARIABLE
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Access	RW
PDO Mapping	No
Value Range	See Table 23
Default Value	0 (null control source)

2.4.48. Object 3yz2h: LTyz Auto Repeat

This object determines whether the lookup table sequence will repeat automatically once the last point in the lookup table has been completed. This object is only taken into effect when the response is set to '*Time Response*'. For more details on the functionality of this object and its effect on the lookup table, please refer to section 1.7.4.

Object Description

Index	3yz2h (where yz = 01 to 08)
Name	LTyz X-Axis Decimal Digits PV
Object Type	VARIABLE
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Access	RW
PDO Mapping	No
Value Range	0 (OFF) to 1 (ON)
Default Value	0 [OFF]

2.4.49.Object 3yz3h: LTyz X-Axis Decimal Digits PV

This object describes the number of digits following the decimal point (i.e. resolution) of the X-Axis input data and the points in the lookup table. It should be set equal to the decimal digits used by the PV from the control source/number as defined in Table 17.

Object Description

Index	3yz3h (where yz = 01 to 08)
Name	LTyz X-Axis Decimal Digits PV
Object Type	VARIABLE
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Access	RW
PDO Mapping	No
Value Range	0 to 3
Default Value	0

2.4.50.Object 3yz4h: LTyz Y-Axis Decimal Digits PV

This object describes the number of digits following the decimal point (i.e. resolution) of the Y-Axis points in the lookup table. When the Y-Axis output is going to be the input to another function block (i.e. an analog output), it is recommended that this value be set equal to the decimal digits used by the block that is using the lookup table as the control source/number.

Object Description

Index	3yz4h (where yz = 01 to 08)
Name	LTyz Y-Axis Decimal Digits PV
Object Type	VARIABLE
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Access	RW
PDO Mapping	No
Value Range	0 to 3
Default Value	0

2.4.51.Object 3yz5h: LTyz Point Response

This object determines the Y-Axis output response to changes in the X-Axis input. The value set in sub-index 1 determines the X-Axis type (i.e. data or time), while all other sub-indexes determine the response (ramp, step, ignore) between two points on the curve. The options for this object are listed in Table 25. See Figure 16 for an example of the difference between a step and ramp response.

Object Description

Index	3yz5h (where yz = 01 to 8)
Name	LTyz Point Response
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	11
Default Value	11

Sub-Index	1h
Description	X-Axis Type
Access	RW
PDO Mapping	No
Value Range	See Table 25 (0 or 1)
Default Value	0 (x-axis data response)

Sub-Index	2h to Bh (x = 2 to 11)
Description	LTyz Point X Response
Access	RW
PDO Mapping	No
Value Range	See Table 25 (0, 1 or 2)
Default Value	1 (ramp to response)

2.4.52.Object 3yz6h: LTyz Point X-Axis PV

This object defines the X-Axis data for the 11 calibration points on the lookup table, resulting in 10 different output slopes.

When a data response is selected for the X-Axis type (sub-index 1 of object 3yz5), this object is constrained such that X1 cannot be less than the Scaling 1 value of the selected control source/number, and X11 cannot be more than the Scaling 2 value. The rest of the points are constrained by the formula below. The physical unit associate with the data will be that of the selected input, and it will use the resolution defined in object 3yz3h, LTz X-Axis Decimal Digits PV.

$$\text{MinInt16} \leq X_1 \leq X_2 \leq X_3 \leq X_4 \leq X_5 \leq X_6 \leq X_7 \leq X_8 \leq X_9 \leq X_{10} \leq X_{11} \leq \text{MaxInt16}$$

When a time response has been selected, each point on the X-Axis can be set anywhere from 1 to 86,400,000ms.

Object Description

Index	3yz6h (where yz = 01 to 8)
Name	LTyz Point X-Axis PV
Object Type	ARRAY
Data Type	INTEGER32

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	11
Default Value	11

Sub-Index	1h to Bh (x = 1 to 11)	
Description	LTyz Point X-Axis PVx	
Access	RW	
PDO Mapping	No	
Value Range	See above (data)	1 to 86400000 (time)
Default Value	10*(x-1)	No

2.4.53.Object 3yz7h: LTyz Point Y-Axis PV

This object defines the Y-Axis data for the 11 calibration points on the lookup table, resulting in 10 different output slopes. The data is unconstrained and has no physical unit associate with it. It will use the resolution defined in object 3yz4h, LTyz Y-Axis Decimal Digits PV.

Object Description

Index	3yz7h (where yz = 01 to 8)
Name	LTz Point Y-Axis PV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
-----------	----

Description	Largest sub-index supported
Access	RO

Value Range	11
Default Value	11

Sub-Index	1h to Bh (x = 1 to 11)
Description	LTyz Point Y-Axis PVx
Access	RW
PDO Mapping	No
Value Range	Integer16
Default Value	10*(x-1) [i.e. 0, 10, 20, 30, ... 100]

2.4.54.Object 3yz8h: LTyz Output Y-Axis PV

This read-only object contains the lookup table function block PV that can be used as the input source for another function block (i.e. analog output.) The physical unit for this object is undefined, and it will use the resolution defined in object 3yz4h, LTz Y-Axis Decimal Digits PV.

Object Description

Index	3yz8h (where yz = 01 to 08)
Name	LTyz Output Y-Axis PV
Object Type	VARIABLE
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Access	RO
PDO Mapping	Yes
Value Range	Integer16
Default Value	No

2.4.55.Object 3300h: Logic Block Enable

This object defines whether or not the logic shown in Figure 19 will be evaluated.

Object Description

Index	3300h
Name	Logic Block Enable
Object Type	ARRAY
Data Type	BOOLEAN

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No

Value Range	4
Default Value	4

Sub-Index	1h to 4h (x = 1 to 4)
Description	LBx Enable
Access	RW
PDO Mapping	No
Value Range	0 (FALSE) or 1 (TRUE)
Default Value	0 [FALSE]

2.4.56.Object 3310h: Logic Block Selected Table

This read-only object reflects what table has been selected as the output source for the logic block after the evaluation shown in Figure 19 has been performed.

Object Description

Index	3310h
Name	Logic Block Selected Table
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (x = 1 to 4)
Description	LBx Selected Table
Access	RO
PDO Mapping	Yes
Value Range	1 to 8
Default Value	No

2.4.57.Object 3320h: Logic Block Output PV

This read-only object reflects the output from the selected table, interpreted as a percentage. The limits for the percentage conversion are based on the range of the lookup tables Y-Axis Output PV as shown in Table 30. This value has a fixed decimal digit value of 1 giving a resolution of 0.1%.

Object Description

Index	3320h
Name	Logic Block Output PV
Object Type	ARRAY

Data Type	UNSIGNED8
-----------	-----------

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (x = 1 to 4)
Description	LBx Output PV
Access	RO
PDO Mapping	Yes

2.4.58.Object 3x01h: LB(3-x) Lookup Table Numbers

This object determines which of the six lookup tables supports on the 2IN-2OUT-SIG-CO are associated with a particular function within the given logic block. Up to three tables can be linked to each logic function.

Object Description

Index	3x01h (where x = 4 to 7)
Name	LB(3-x) Lookup Table Numbers
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	3
Default Value	3

Sub-Index	1h to 3h (y = A to C)
Description	LB(x-3) Lookup Table Y Number
Access	RW
PDO Mapping	No
Value Range	1 to 6
Default Value	See Table 18

2.4.59.Object 3x02h: LB(3-x) Function Logical Operator

This object determines how the results of the three conditions for each function are to be compared to one another to determine the overall state of the function output. There are up to three functions that can be evaluated in each logic block. The options for this object are defined in Table 29. See Section 1.8 for more information about how this object is used.

Object Description

Index	3x02h (where x = 4 to 7)
Name	LB(3-x) Function Logical Operator
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	3
Default Value	3

Sub-Index	1h to 3h (y = A to C)
Description	LB(x-3) Function Y Logical Operator
Access	RW
PDO Mapping	No
Value Range	See Table 29
Default Value	Function A = 1 (and all) Function B = 1 (and all) Function C = 0 (default)

2.4.60.Object 3x11h: LB(3-x) Function A Condition 1

See section 2.4.68.

2.4.61.Object 3x12h: LB(3-x) Function A Condition 2

See section 2.4.68.

2.4.62.Object 3x13h: LB(3-x) Function A Condition 3

See section 2.4.68.

2.4.63.Object 3x21h: LB(3-x) Function B Condition 1

See section 2.4.68.

2.4.64.Object 3x22h: LB(3-x) Function B Condition 2

See section 2.4.68.

2.4.65.Object 3x23h: LB(3-x) Function B Condition 3

See section 2.4.68.

2.4.66.Object 3x31h: LB(3-x) Function C Condition 1

See section 2.4.68.

2.4.67.Object 3x32h: LB(3-x) Function C Condition 2

See section 2.4.68.

2.4.68.Object 3x33h: LB(3-x) Function C Condition 3

These objects, 3xyzh, represent Logic Block x, Function y, Condition z, where x = 4 to 7, y = 1 (A) to 3 (C), and z = 1 to 3. All of these objects are a special type of record, defined in Table 26. Information on how to use these objects is defined in Section 1.8.

Object Description

Index	3xyzh
Name	LB(3-x) Function y Condition z
Object Type	RECORD
Data Type	UNSIGNED8

Access	RW
PDO Mapping	No
Value Range	See Table 27
Default Value	0 (Equals)

2.4.69.Object 4000h: Math Function Enable

The corresponding sub-index of object must be set TRUE in order for a math function block to be enabled. Otherwise, the output will always be at 0.

Object Description

Index	4000h
Name	Math Function Enable
Object Type	ARRAY
Data Type	BOOLEAN

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (Y = 1 to 4)
Description	Math Y Enable
Access	RW
PDO Mapping	No
Value Range	0 (FALSE) or 1 (TRUE)
Default Value	0 [FALSE]

2.4.70.Object 4021h: Math Output Scaling 1 PV

This object defines the process value that would correspond to 0% output from the math calculation. The object would apply the resolution defined in object 4532h Math Output Decimal Digits PV. The physical unit is undefined.

Object Description

Index	4021h
Name	Math Output Scaling 1 PV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (Y = 1 to 4)
Description	Math Y Output Scaling 1 PV
Access	RW
PDO Mapping	No
Value Range	-32768 to 32767
Default Value	0

2.4.71.Object 4023h: Math Output Scaling 2 PV

This object defines the process value that would correspond to 100% output from the math calculation. The object would apply the resolution defined in object 4532h Math Output Decimal Digits PV. The physical unit is undefined.

Object Description

Index	4023h
Name	Math Output Scaling 2 PV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (Y = 1 to 4)
Description	Math Y Output Scaling 2 PV

Access	RW
PDO Mapping	No
Value Range	-32768 to 32767
Default Value	10000 (100.00)

2.4.72.Object 4030h: Math Output Process Value

This read-only object reflects the output from the math function block after it has been scaled by objects 4021h and 4023h. The object would apply the resolution defined in object 4032h Math Output Decimal Digits PV. The physical unit is undefined.

Object Description

Index	4030h
Name	Math Output Process Value
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (Y = 1 to 4)
Description	Math Y Output Process Value
Access	RO
PDO Mapping	Yes
Value Range	-32768 to 32767
Default Value	No

2.4.73.Object 4032h: Math Output Decimal Digits PV

This object describes the number of digits following the decimal point (i.e. resolution) of the output data, which is interpreted with data type Integer16 in the process value object.

Object Description

Index	4032h
Name	Math Output Decimal Digits PV
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (Y = 1 to 4)
Description	Math Y Decimal Digits PV
Access	RW
PDO Mapping	No
Value Range	0 to 4
Default Value	2 (0.01)

2.4.74.Object 4y00h: Math Y Input Source

This object defines the input sources that will be used in the mathematical calculations. Here, $y = 1$ to 4 – representing Math Block 1 to Math Block 4. If a control source is not used, the associate mathematical calculation would be ignored. The available control sources on the 2IN-2OUT-SIG-CO controller are listed in Table 15.

Object Description

Index	4y00h ($y = 1$ to 4)
Name	Math Y Input Source
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (X = 1 to 4)
Description	Math Y Input X Source
Access	RW
PDO Mapping	No
Value Range	See Table 22
Default Value	0 (control source not used)

2.4.75.Object 4y01h: Math Y Input Number

This object defines the number of the input source that will be used in the math calculation. The available control numbers are dependent on the source selected, as shown in Table 23. Once selected, the input value will be used in the corresponding calculation as described in Section 1.9.

Object Description

Index	4y01h (y = 1 to 4)
Name	Math Y Input Number
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (X = 1 to 4)
Description	Math Y Input X Number
Access	RW
PDO Mapping	No
Value Range	See Table 23
Default Value	0 (null input)

2.4.76.Object 4y03h: Math Y Input Decimal Digits FV

This object describes the number of digits following the decimal point (i.e. resolution) of the input data, which is interpreted with data type Integer16 in the field value object.

Object Description

Index	4y03h (y = 1 to 4)
Name	Math Y Input Decimal Digits FV
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (X = 1 to 4)
Description	Math Y Input X Decimal Digits PV
Access	RW
PDO Mapping	No

Value Range	0 to4
Default Value	2 (0.01)

2.4.77.Object 4y20h: Math Y Input Scaling 1 FV

This object defines the input field value that would correspond to 0% when scaling the input for use in the math calculation. All inputs are normalized to a percentage before being used by the math function block. The object would apply the resolution defined in object 4y03h Math Y Input Decimal Digits FV. The physical unit would match that of the input source.

Object Description

Index	4y20h (y = 1 to 4)
Name	Math Y Input Scaling 1 FV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (X = 1 to 4)
Description	Math Y Input X Scaling 1 FV
Access	RW
PDO Mapping	No
Value Range	INTEGER16
Default Value	0

2.4.78.Object 4y22h: Math Y Input Scaling 2 FV

This object defines the input field value that would correspond to 100% when scaling the input for use in the math calculation. All inputs are normalized to a percentage before being used by the math function block. The object would apply the resolution defined in object 4y03h Math Y Input Decimal Digits FV. The physical unit would match that of the input source.

Object Description

Index	4y22h (y = 1 to 4)
Name	Math Y Input Scaling 2 FV
Object Type	ARRAY
Data Type	INTEGER16

Entry Description

Sub-Index	0h
Description	Largest sub-index supported

Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (X = 1 to 4)
Description	Math Y Input X Scaling 2 FV
Access	RW
PDO Mapping	No
Value Range	INTEGER16
Default Value	10000 (100.00%)

2.4.79.Object 4y40h: Math Y Input Gain

This object can be used to adjust the ‘weight’ of the input in the math calculation. It is a multiplier of the input after it has been converted into a percentage, before it is used in the math calculation. This object has a fixed resolution of 2 decimal digits.

Object Description

Index	4y40h (y = 1 to 4)
Name	Math Y Input Gain
Object Type	ARRAY
Data Type	INTEGER8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported
Access	RO
PDO Mapping	No
Value Range	4
Default Value	4

Sub-Index	1h to 4h (X = 1 to 4)
Description	Math Y Input X Gain
Access	RW
PDO Mapping	No
Value Range	-100 to 100
Default Value	100 (1.0)

2.4.80.Object 4y50h: Math Y Operator

This object defines the actual operators that will be used in each stage of a math calculation, as described in Section 1.9. The options for this object are listed in Table 30.

Object Description

Index	4y50h (y = 1 to 4)
-------	--------------------

Name	Math Y Operator
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-Index	0h
Description	Largest sub-index supported

Default Value	3

Sub-Index	1h to 3h (X = 1 to 3)
Description	Math Y Function X Operator
Access	RW
PDO Mapping	No
Value Range	See Table 32
Default Value	9 (Plus)

2.4.81.Object 5010h: Constant Field Value

This object is provided to allow the user to compare against a fixed value, i.e. for setpoint control in a PID loop, or in a conditional evaluation for a logic block. The first two values in this object are fixed at FALSE (0) and TRUE (1). There are ten other sub-indexes provide for other unconstrained data.

Object Description

Index	5010h

Sub-Index	11
Description	Constant FV 11
Access	RW
PDO Mapping	No
Value Range	Float32
Default Value	90.00

Sub-Index	12
Description	Constant FV 12
Access	RW
PDO Mapping	No
Value Range	Float32
Default Value	100.00

2.4.82.Object 5040h: FD Field Value

This read-only object is available for diagnostic feedback purposes. It reflects the measured over/under voltage powering the controller as well as the internal microcontroller temperature. FD1 is over temperature fault detection, FD2 power over voltage fault detection and FD3 power under voltage detection. The physical unit for this object is volts and °C, respectively.

Object Description

Index	5040h
Name	FD_Field_Value
Object Type	VARIABLE
Data Type	FLOAT32

Entry Description

Sub-Index	0h
Access	RO
PDO Mapping	Yes
Value Range	3
Default Value	3

Sub-Index	1h
Description	FD1_Field_Value
Access	RO
PDO Mapping	Yes
Value Range	0 to 1250 [°C x 10]
Default Value	0

Sub-Index	2h
Description	FD2_Field_Value
Access	RO
PDO Mapping	Yes
Value Range	0 to 500 [V x 10]

Default Value	0
Sub-Index	3h
Description	FD3_Field_Value
Access	RO
PDO Mapping	Yes
Value Range	0 to 500 [V x 10]
Default Value	0

2.4.83.Object 5041h: FD Set Threshold

This object sets the value that will flag a fault detection error in the 2IN-2OUT-SIG-CO if the measured field value (5040h) goes above (FD 1 and FD 2) or below (FD 3) this limit. If error checking on the fault is enabled by object 5050h, then the module will flag an appropriate error on that channel. This value must be in the same units as the field value for the fault, as determined by the sub-index.

Object Description

Index	5041h
Name	FD Set Threshold
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Subindex	0h
Description	Number of entries
Access	RO
PDO Mapping	No
Value Range	3
Default Value	3

Sub-index	1h
Description	FD1 Set Threshold
Access	RW
PDO Mapping	No
Value Range	5042h at sub-index 1 to 1250 [$^{\circ}\text{C} \times 10$]
Default Value	1100 (110.0 $^{\circ}\text{C}$)

Sub-index	2h
Description	FD2 Set Threshold
Access	RW
PDO Mapping	No
Value Range	5042h at sub-index 2 to 1000 [V x 10]
Default Value	500 (50.0V)

Sub-index	3h
Description	FD3 Set Threshold
Access	RW
PDO Mapping	No
Value Range	80 to 5042h at sub-index 3 [V x 10]
Default Value	90 (9.0V)

2.4.84.Object 5042h: FD Clear Threshold

This object sets the value that will clear a fault detection error in the 2IN-2OUT-SIG-CO if the measured field value (5040h) goes below (FD 1 and FD 2) or above (FD 3) this threshold. This value must be in the same units as the field value for the fault, as determined by the sub-index.

Object Description

Index	5042h
Name	FD Clear Threshold
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Subindex	0h
Description	Number of entries
Access	RO
PDO Mapping	No
Value Range	3
Default Value	3

Subindex	1h
Description	FD1 Clear Threshold
Access	RW
PDO Mapping	No
Value Range	500 to 5041h at subindex 1 [$^{\circ}\text{C} \times 10$]
Default Value	850 (85.0 $^{\circ}\text{C}$)

Subindex	2h
Description	FD2 Clear Threshold
Access	RW
PDO Mapping	No
Value Range	5042h at subindex 3 to 5041h at subindex 2 [V $\times 10$]
Default Value	480 (48.0V)

Subindex	3h
Description	FD3 Clear Threshold
Access	RW
PDO Mapping	No
Value Range	5041h at subindex 3 to 5042h at subindex 2 [V $\times 10$]
Default Value	120 (12.0V)

2.4.85.Object 5050h: FD Enable Error Check 3 Faults

This object enables or disables the fault detection error-checking feature for each fault detectable by the 2IN-2OUT-SIG-CO. The bitmap for this object at sub-index 1 is:

- Bit 0: Over Temperature Detection
- Bit 1: Over Voltage Detection
- Bit 2: Under Voltage Detection

Object Description

Index	5050h
Name	FD Enable Error Checking 3 Faults
Object Type	ARRAY
Data Type	UNSIGNED8

Entry Description

Sub-index	0h
Description	Number of entries
Access	RO
PDO Mapping	No
Value Range	1
Default Value	1

Sub-index	1h
Description	Error Check for FD 1 to FD 3
Access	RW
PDO Mapping	No
Value Range	Bit Value 0 = Error Check Disabled Bit Value 1 = Error Check Enabled
Default Value	00h (all error check disabled)

2.4.86.Object 5051h: FD Error Response Delay

This object is used to prevent intermittent faults from overloading the bus with error messages. The value is defined as a multiple of 1ms. If a fault has been present during the entirety of the delay time, the 2IN-2OUT-SIG-CO Controller will flag an error of the detected fault once the timer has expired. The object can be set to zero, in which case a fault will immediately trigger an error response. FD1 is over temperature fault detection, FD2 power over voltage fault detection and FD3 power under voltage detection.

Object Description

Index	5051h
Name	FD Error Response Delay
Object Type	ARRAY
Data Type	UNSIGNED16

Entry Description

Subindex	0h
Description	Number of entries
Access	RO
PDO Mapping	No
Value Range	3
Default Value	3

Subindex	1h to 3h (x = 1 to 3)
Description	FDx Error Response Delay
Access	RW
PDO Mapping	No
Value Range	0 to 10000 [ms]
Default Value	5000 [ms]

2.4.87.Object 5550h: Enable Automatic Updates

This object allows the controller to update objects to defaults automatically when an input type is changed. By default this object is TRUE.

Object Description

Index	5550h
Name	Enable Auto Updates
Object Type	VARIABLE
Data Type	BOOLEAN

Entry Description

Sub-Index	0h
Access	RW
PDO Mapping	No
Value Range	0 (FALSE) or 1 (TRUE)
Default Value	1 [TRUE]

2.4.88.Object 5555h: Start in Operational Mode

This object allows the unit to start in Operational mode without requiring the presence of a CANopen® Master on the network. It is intended to be used only when running the 2IN-2OUT-SIG-CO controller as a stand-alone module. This should always be set FALSE whenever it is connected to a standard master/slave network.

Object Description

Index	5555h
Name	Start in Operational Mode
Object Type	VARIABLE
Data Type	BOOLEAN

Entry Description

Sub-Index	0h
Access	RW
PDO Mapping	No
Value Range	0 (FALSE) or 1 (TRUE)
Default Value	0 [FALSE]

APPENDIX A - TECHNICAL SPECIFICATION

Power Supply

Power Supply Input	12 Vdc or 24 Vdc nominal 9...36 Vdc power supply range Shutdown voltage is 8.0 Vdc.
Protection	Reverse polarity protection Overvoltage protection is up to 45 V.

Inputs

Inputs	2 Universal Signal Inputs User programmable as Voltage, Current, Resistive, Frequency, RPM, PWM or Digital signal inputs types. Refer to Table 1.0.																																												
Table 1.0 –User Programmable Universal Inputs																																													
Analog & Digital Input Functions	Voltage Input, Current Input, Resistive Input or Digital Input 12 bit Analog to Digital																																												
Voltage Input	0-5 V (Impedance 110 kΩ) 0-10 V (Impedance 130 kΩ) +/- 5V (Impedance 110 KΩ) +/- 10V (Impedance 130 KΩ)																																												
Current Input	0-200 mA (Impedance 5 Ω); 1V max. 0-20 mA (Impedance 249 Ω) 4-20 mA (Impedance 249 Ω)																																												
Resistive	20 Ohms to 250 kOhms Self-calibrating																																												
Digital Input Level	Accepts 5 V TTL Accepts up to Vps Threshold: Low <1 V High >2.2 V Normal, Inverse or Latched 10kΩ Pull up/Pull down																																												
Digital Input	Active High or Active Low with 10 kOhm pull-up or pull-down																																												
Timer Input Functions	PWM Input, Frequency Input, RPM Input 15-bit Timer																																												
PWM Input	Low Frequency (10 Hz to 1 kHz) High Frequency (100 Hz to 10 kHz) 0 to 100% D.C.																																												
Frequency/RPM Input	0.5 Hz to 50 Hz; 10 Hz to 1 kHz; or 100 Hz to 10 kHz 1 to 99% D.C.																																												
Maximum and Minimum Ratings	<table border="1"> <thead> <tr> <th>Characteristic</th> <th>Min</th> <th>Max</th> <th>Units</th> </tr> </thead> <tbody> <tr> <td>Power Supply</td> <td>9</td> <td>36</td> <td>V dc</td> </tr> <tr> <td>Voltage Input</td> <td>0</td> <td>36</td> <td>V dc</td> </tr> <tr> <td>Current Input 0(4)-20 mA</td> <td>0</td> <td>12</td> <td>Vdc</td> </tr> <tr> <td>Current Input 0-200 mA</td> <td>0</td> <td>1V</td> <td>Vdc</td> </tr> <tr> <td>Resistive Input</td> <td>30</td> <td>250 000</td> <td>Ω</td> </tr> <tr> <td>Digital Input</td> <td>0</td> <td>36</td> <td>Vdc</td> </tr> <tr> <td>PWM Duty Cycle</td> <td>0</td> <td>100</td> <td>%</td> </tr> <tr> <td>PWM Frequency</td> <td>100</td> <td>10 000</td> <td>Hz</td> </tr> <tr> <td>PWM Voltage pk - pk</td> <td>0</td> <td>36</td> <td>V dc</td> </tr> <tr> <td>RPM Frequency</td> <td>0.5</td> <td>10 000</td> <td>Hz</td> </tr> </tbody> </table>	Characteristic	Min	Max	Units	Power Supply	9	36	V dc	Voltage Input	0	36	V dc	Current Input 0(4)-20 mA	0	12	Vdc	Current Input 0-200 mA	0	1V	Vdc	Resistive Input	30	250 000	Ω	Digital Input	0	36	Vdc	PWM Duty Cycle	0	100	%	PWM Frequency	100	10 000	Hz	PWM Voltage pk - pk	0	36	V dc	RPM Frequency	0.5	10 000	Hz

Voltage Reference	+5V, 50 mA Ground is shared with Input Grounds.																																																						
Protection for Output Terminals	Fully protected against short circuit to output ground. Unit will fail safe in the case of a short circuit condition, self-recovering when the short is removed.																																																						

General Specifications

Microprocessor	STM32F205VGT
Isolation	300 Vrms 4-way Digital Isolation (Power, Inputs, Outputs and CAN are isolated from each other.)
Typical Quiescent Current	150 mA @ 12Vdc; 75 mA @ 24Vdc
Response Time	30 milliseconds
Control Logic	Standard embedded software is provided.

	<i>(Application-specific control logic or a set point file is available on request.)</i>
Communications	1 Isolated CAN port (CANopen®)
Network Termination	It is necessary to terminate the network with external termination resistors. The resistors are 120 Ohm, 0.25W minimum, metal film or similar type. They should be placed between CAN_H and CAN_L terminals at both ends of the network.
User Interface	EDS File provided to interface to standard CANopen® tools
Operating Conditions	-40 to 85 °C (-40 to 185 °F)
Storage Temperature	-55 to 125 °C (-67 to 257°F)
Protection	IP67
Compliance	CE mark pending
Vibration	MIL-STD-202G, Test 204D and 214A (Sine and Random) 10 g peak (Sine) 7.86 Grms peak (Random)
Shock	MIL-STD-202G, Test 213B 50g
Weight	0.55 lb. (0.249 kg)
Enclosure	High Temperature Nylon PCB Enclosure - (equivalent TE Deutsch P/N: EEC-325X4B) 4.62 x 5.24 x 1.43 inches 117.42 x 133.09 x 36.36 mm (W x L x H excluding mating plugs) Refer to the dimensional drawing.
Installation	<p>For mounting information, refer to the dimensional drawing.</p> <p>Mounting holes sized for 1/4 inch or M6 bolts. The bolt length will be determined by the end-user's mounting plate thickness. The mounting flange of the controller is 0.63 inches (16 mm) thick.</p> <p>If the module is mounted without an enclosure, it should be mounted vertically with connectors facing left and right to reduce likelihood of moisture entry.</p> <p>The CAN wiring is considered intrinsically safe. The power wires are not considered intrinsically safe and so in hazardous locations, they need to be located in conduit or conduit trays at all times. The module must be mounted in an enclosure in hazardous locations for this purpose.</p> <p>No wire or cable harness should exceed 30 meters in length. The power input wiring should be limited to 10 meters.</p> <p>All field wiring should be suitable for the operating temperature range.</p> <p>Install the unit with appropriate space available for servicing and for adequate wire harness access (6 inches or 15 cm) and strain relief (12 inches or 30 cm).</p>

Dimensional Drawing

Electrical Connections 12 pin receptacle (equivalent TE Deutsch P/N: DTM13-12PA-R008)

Pin #	Description

12	Analog/Digital Output 1+

20 AWG wire is recommended for use with contacts 0462-201-20141.
Mating plug KIT: Available from Axiomatic as p/n: **PL-DTM06-12SA**.
It is comprised of the following TE Deutsch P/N equivalents: plug (DTM06-12SA);
wedgelock (WM12S); and 12 contacts (0462-201-20141) as well as 6 sealing plugs
(0413-204-2005).

Specifications are indicative and subject to change. Actual performance will vary depending on the application and operating conditions. Users should satisfy themselves that the product is suitable for use in the intended application. All our products carry a limited warranty against defects in material and workmanship. Please refer to our Warranty, Application Approvals/Limitations and Return Materials Process as described on <https://www.axiomatic.com/service/>

OUR COMPANY

Axiomatic provides electronic machine control components to the off-highway, commercial vehicle, electric vehicle, power generator set, material handling, renewable energy and industrial OEM markets. **We innovate with engineered and off-the-shelf machine controls that add value for our customers.**

QUALITY DESIGN AND MANUFACTURING

We have an ISO9001:2015 registered design/manufacturing facility in Canada.

WARRANTY, APPLICATION APPROVALS/LIMITATIONS

Axiomatic Technologies Corporation reserves the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. Users should satisfy themselves that the product is suitable for use in the intended application. All our products carry a limited warranty against defects in material and workmanship. Please refer to our Warranty, Application Approvals/Limitations and Return Materials Process at <https://www.axiomatic.com/service/>.

COMPLIANCE

Product compliance details can be found in the product literature and/or on axiomatic.com. Any inquiries should be sent to sales@axiomatic.com.

SAFE USE

All products should be serviced by Axiomatic. Do not open the product and perform the service yourself.

This product can expose you to chemicals which are known in the State of California, USA to cause cancer and reproductive harm. For more information go to www.P65Warnings.ca.gov.

SERVICE

All products to be returned to Axiomatic require a Return Materials Authorization Number (RMA#) from sales@axiomatic.com. Please provide the following information when requesting an RMA number:

- Serial number, part number
- Runtime hours, description of problem
- Wiring set up diagram, application and other comments as needed

DISPOSAL

Axiomatic products are electronic waste. Please follow your local environmental waste and recycling laws, regulations and policies for safe disposal or recycling of electronic waste.
